

SOME

WORDS

This project began from seeing an upside down tree floating in the sky in August of 2020 from the fire escape of my apartment in Brooklyn. Strangely, later that day, a stranger on social media uploaded a picture of the glitch I saw, but from a highway in California.

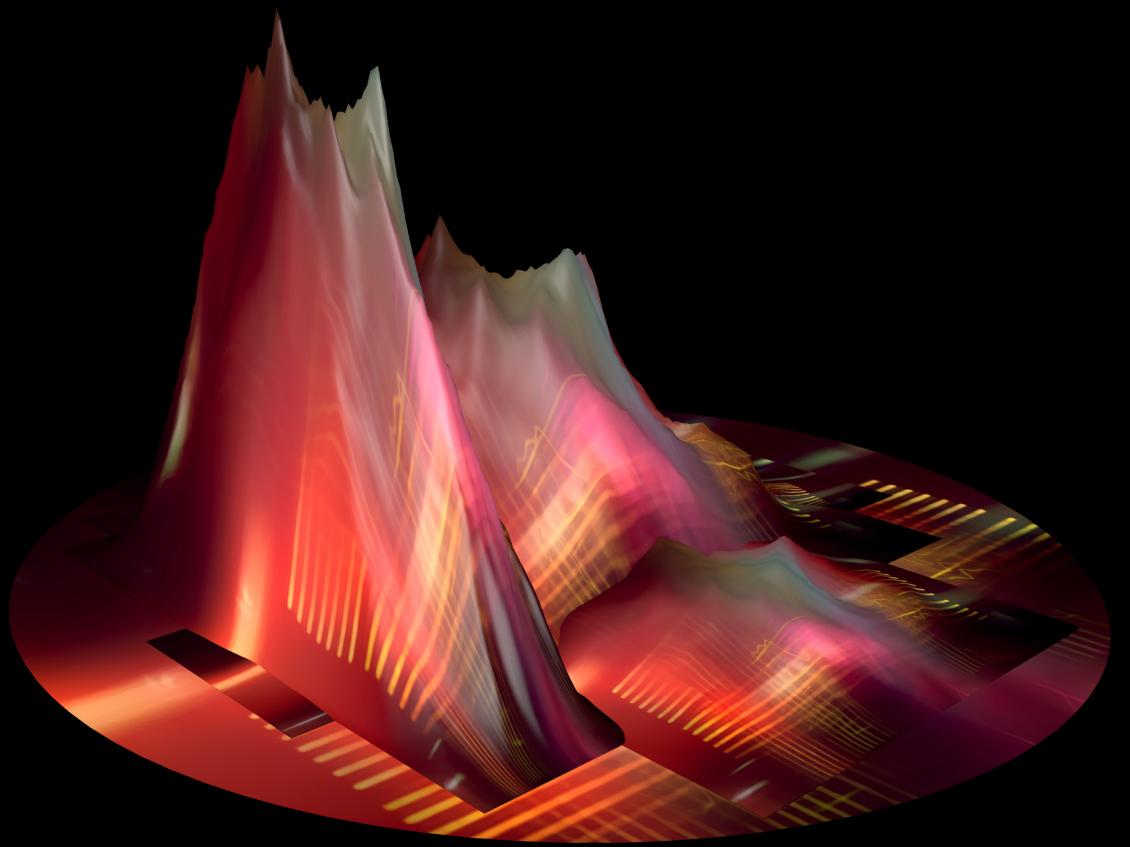

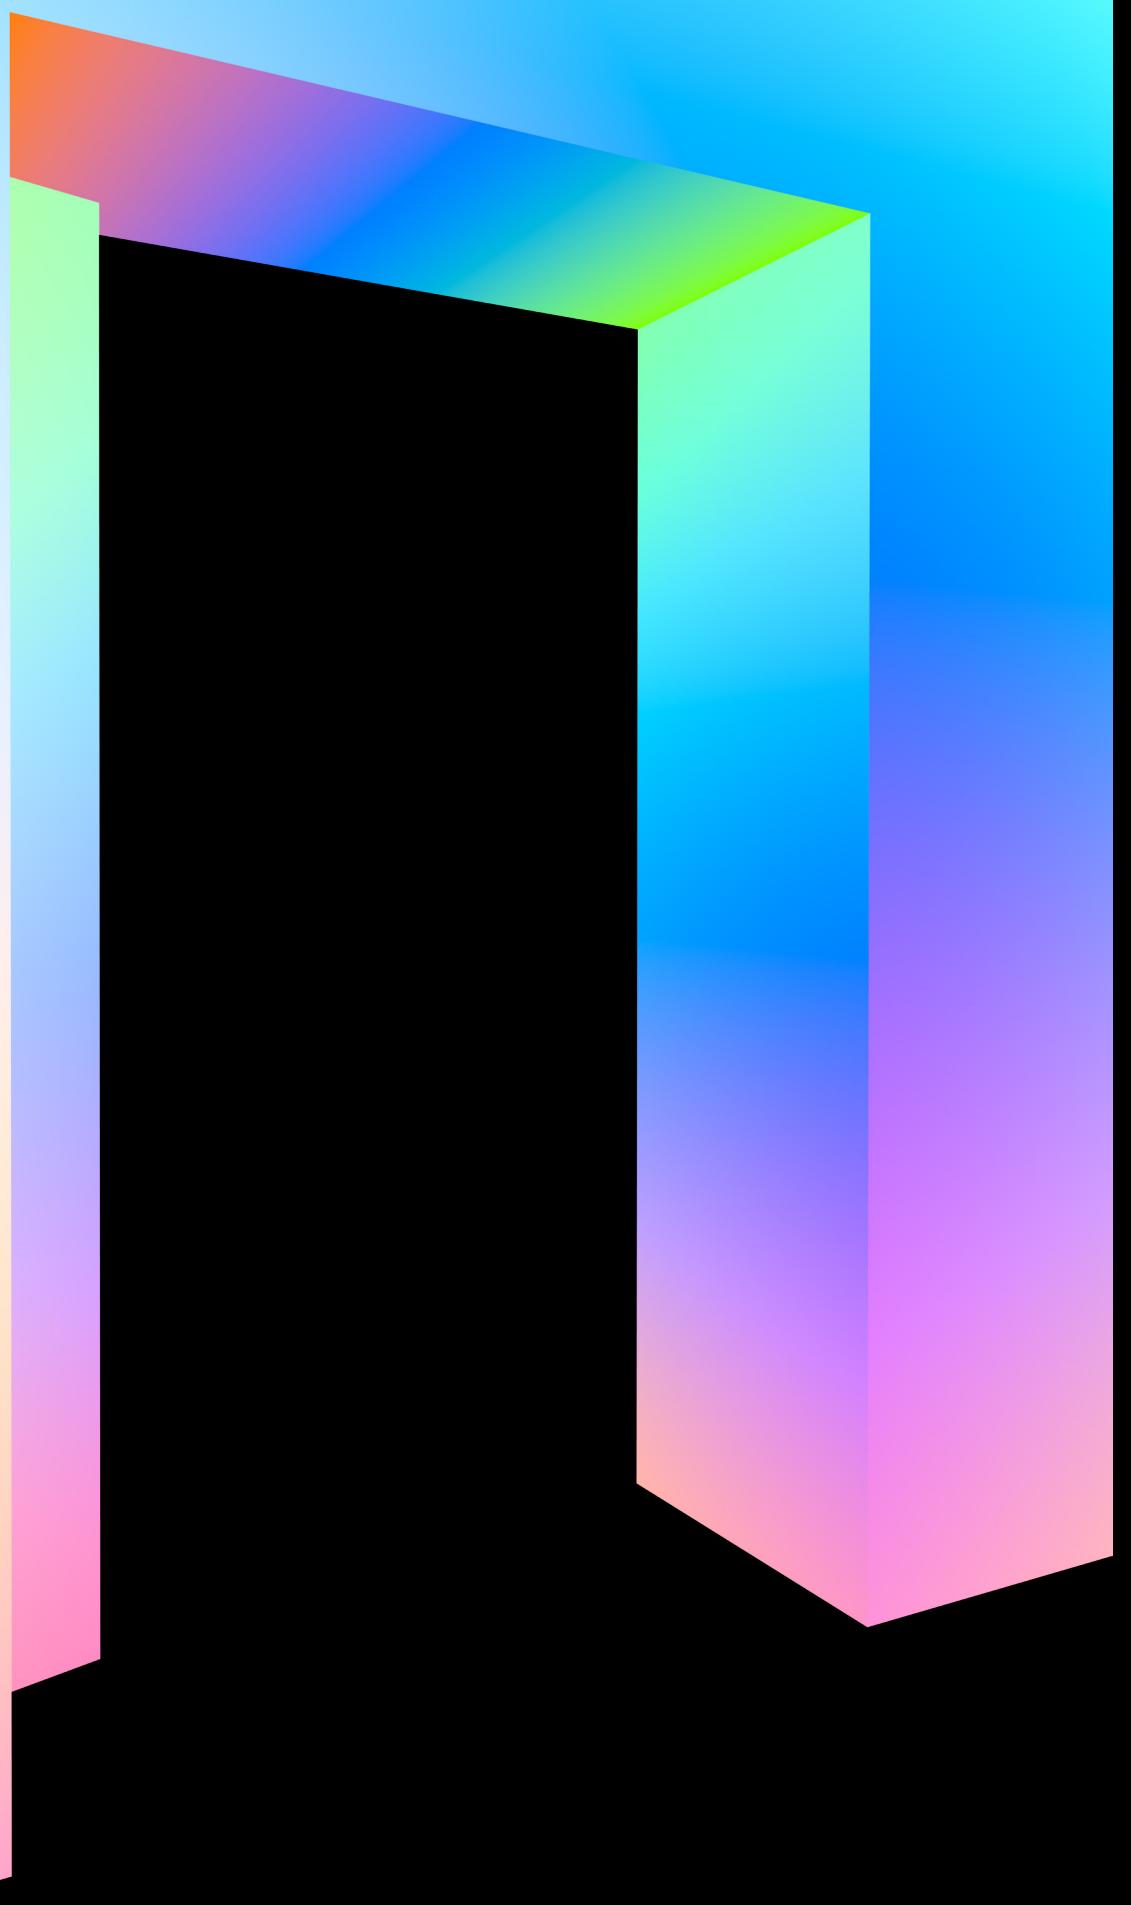

The topic of alternate realities or a multiverse is one many people are familiar with, whether through television shows or books. I wanted to visualize my own theories of what those places look like, the laws that govern them, and the in-betweens.

Ages like 19, 29, 39, and on embody the concept that previously unimaginable events like dimension travelling can happen then and only then. This is due to the fact that 9 is the closest lower number to 10, a divine number representing perfection, maximum creativity, and wholeness. 9 is almost there, but not quite, resulting in a fractured and chaotic multiverse that becomes accessible.

Travel through this guide book to visit dimensions generated each day for 29 days.

SECTION ONE

RULES + THINGS

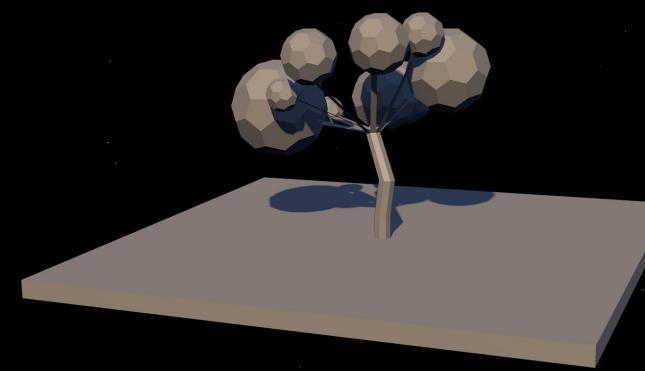

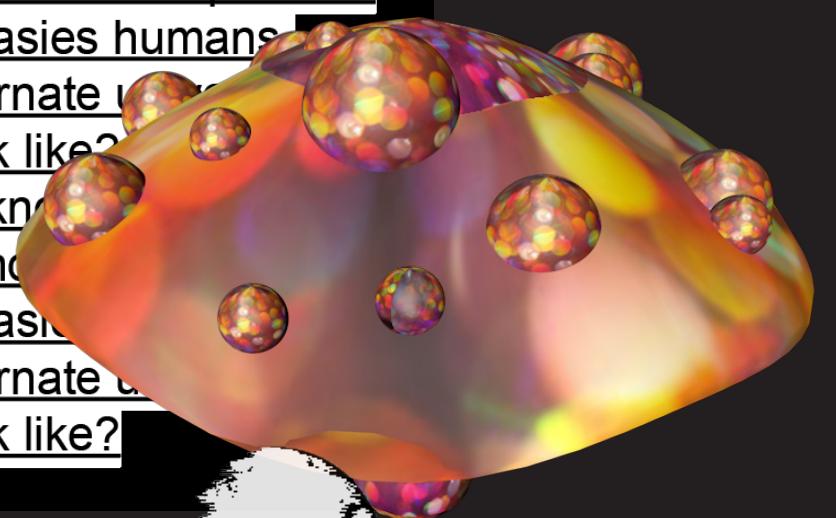

Mushrooms are known to be
hallucinogenic and often represent
magic in the fantasies humans
create. In an alternate universe,
what do they look like?

PLACES + HAPPENINGS

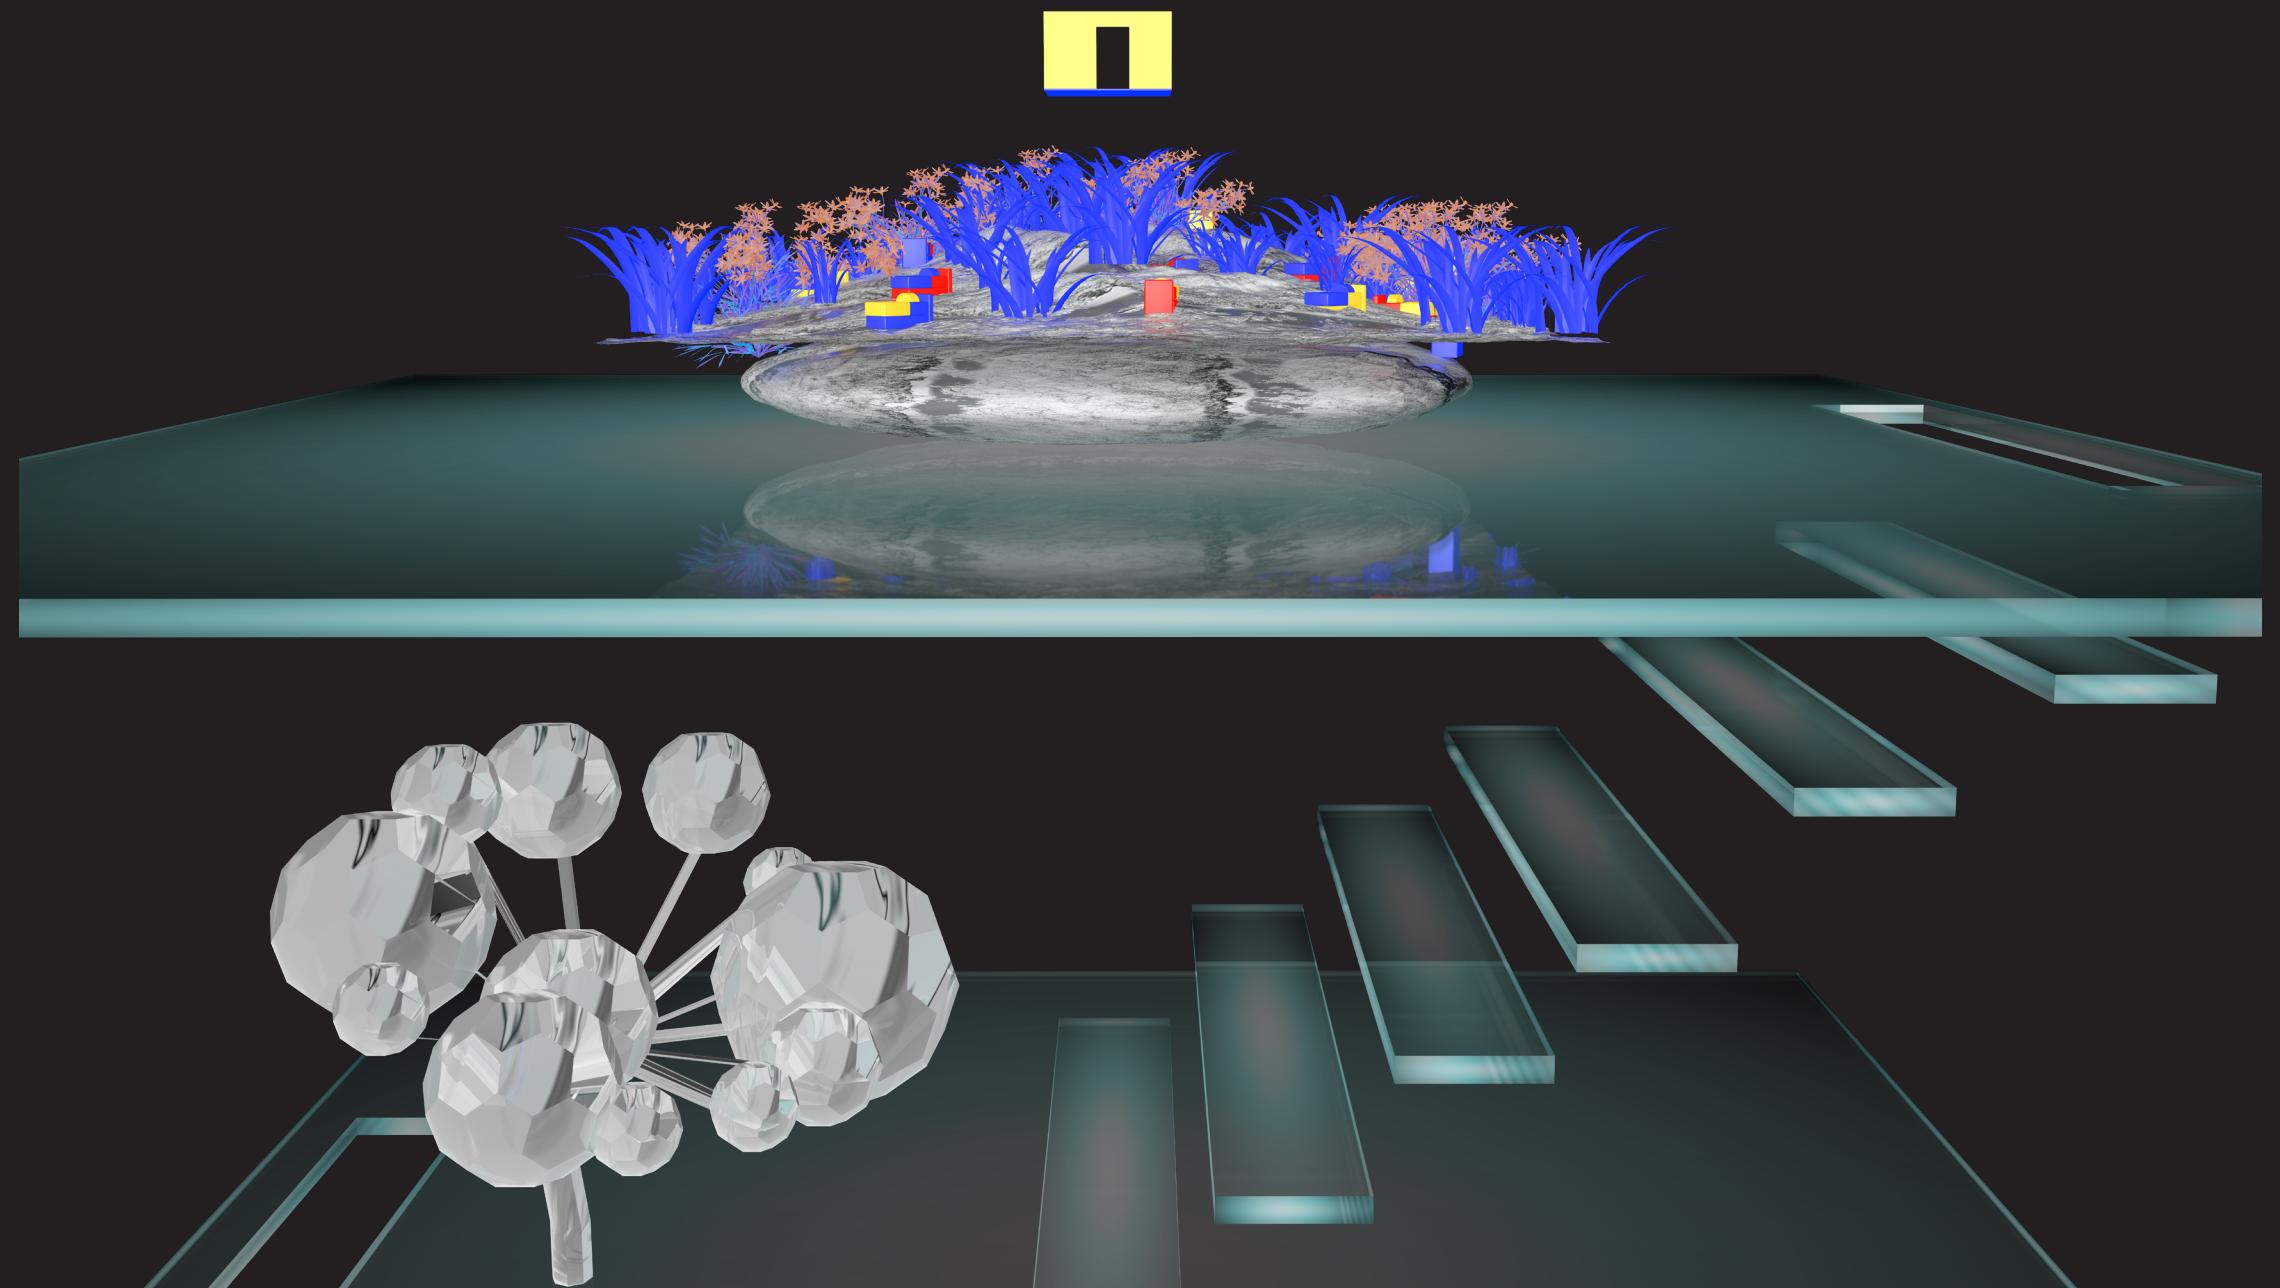

SECTION TWO

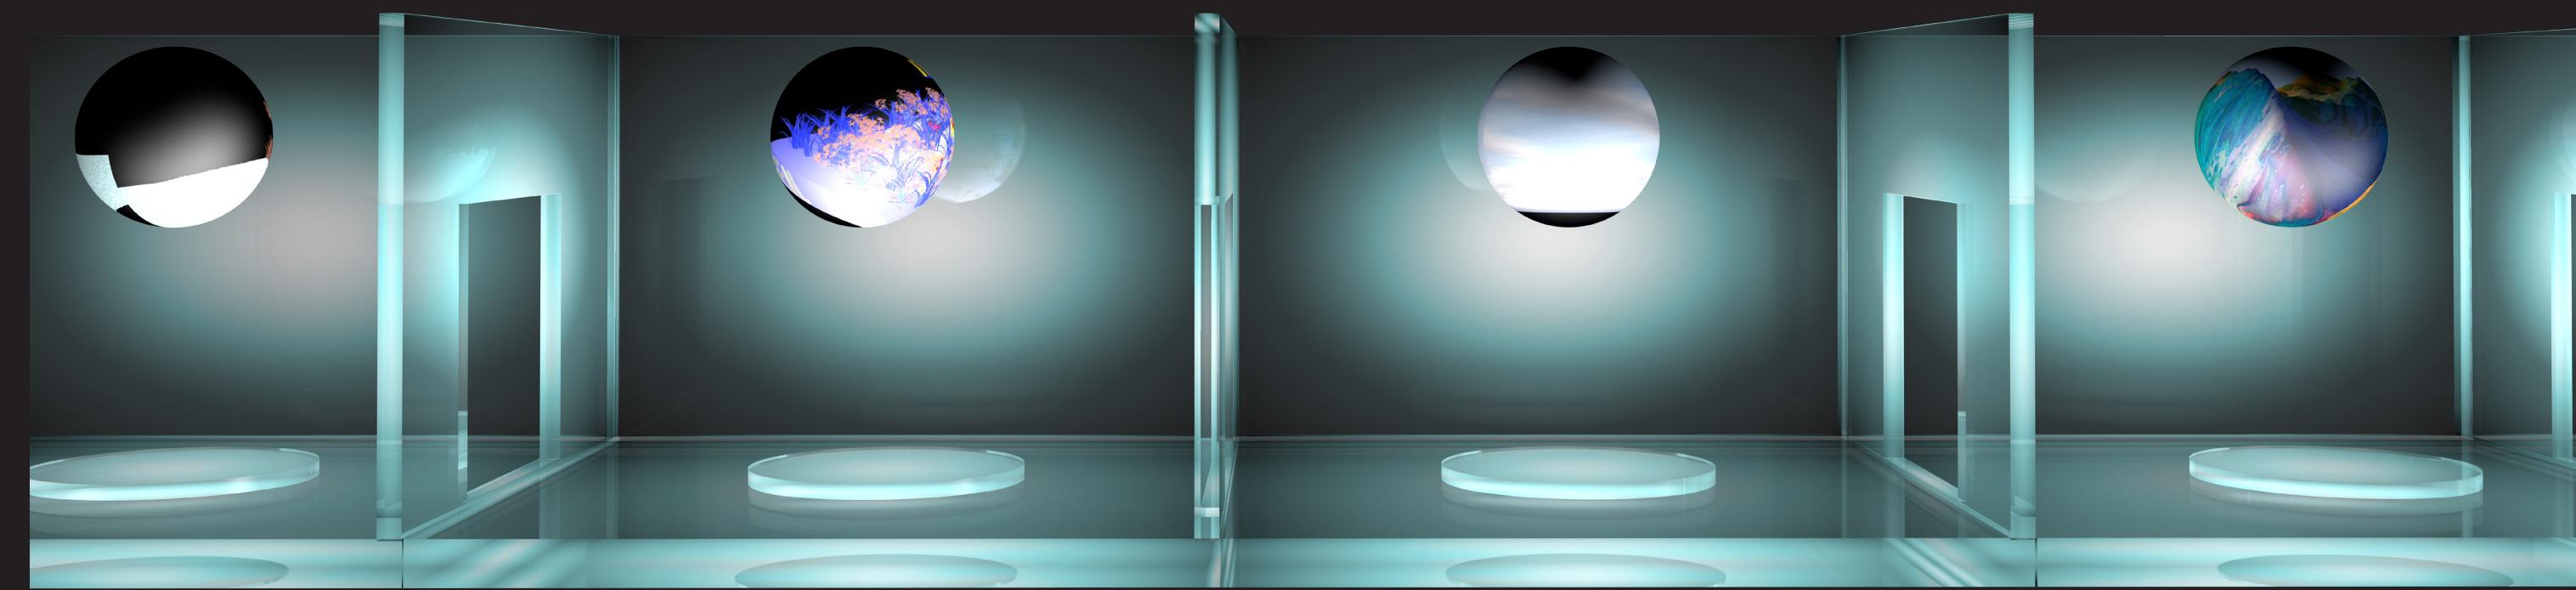

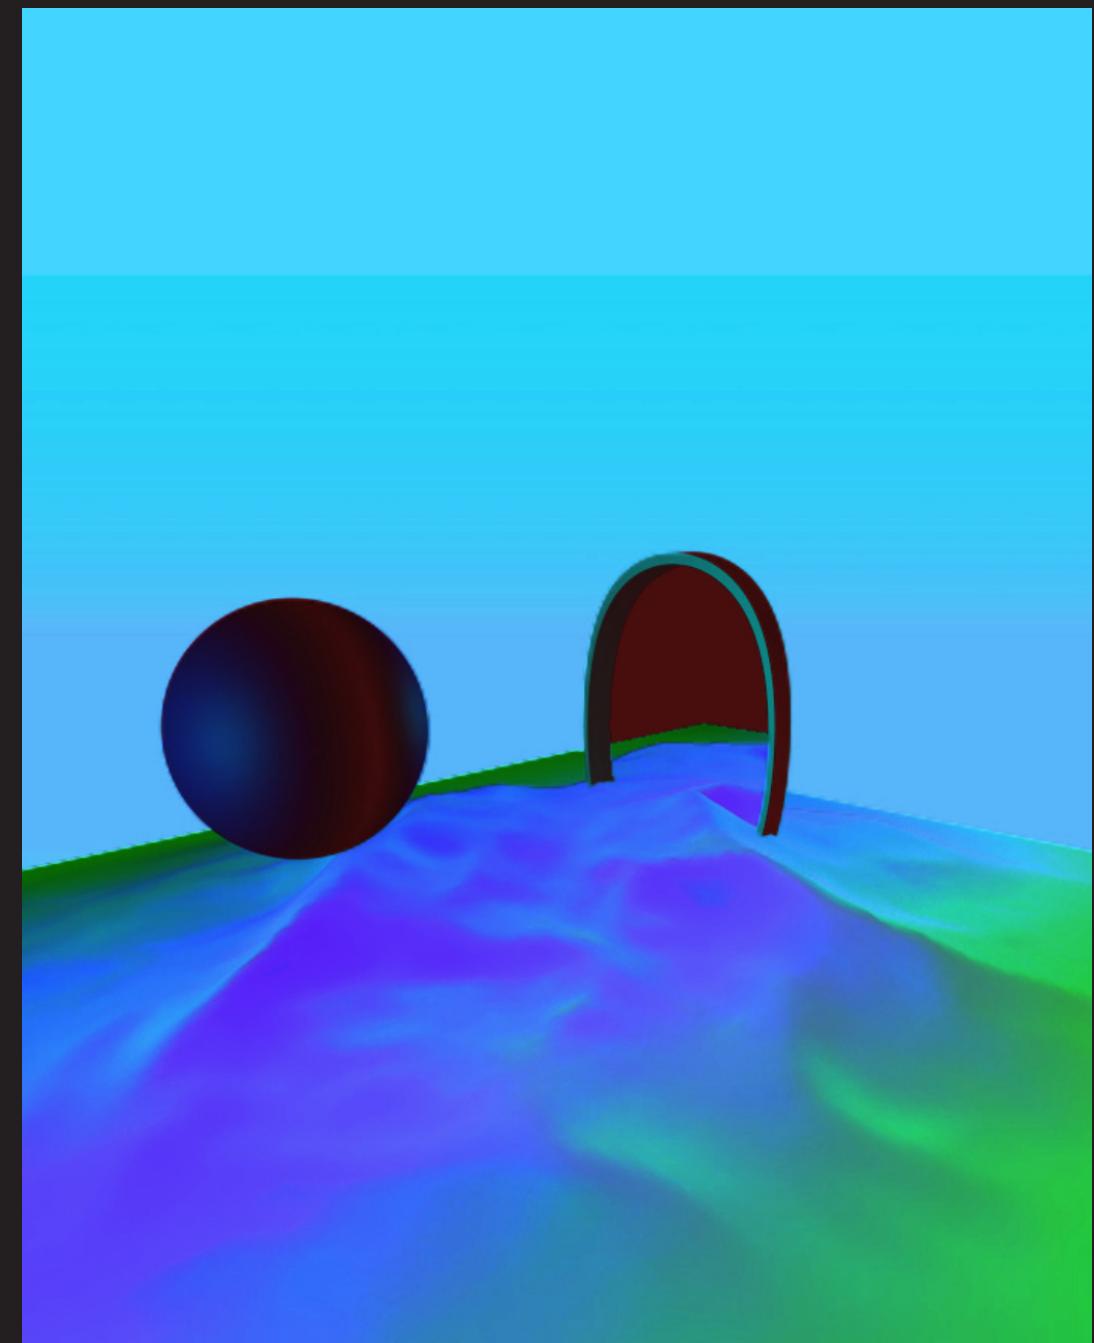

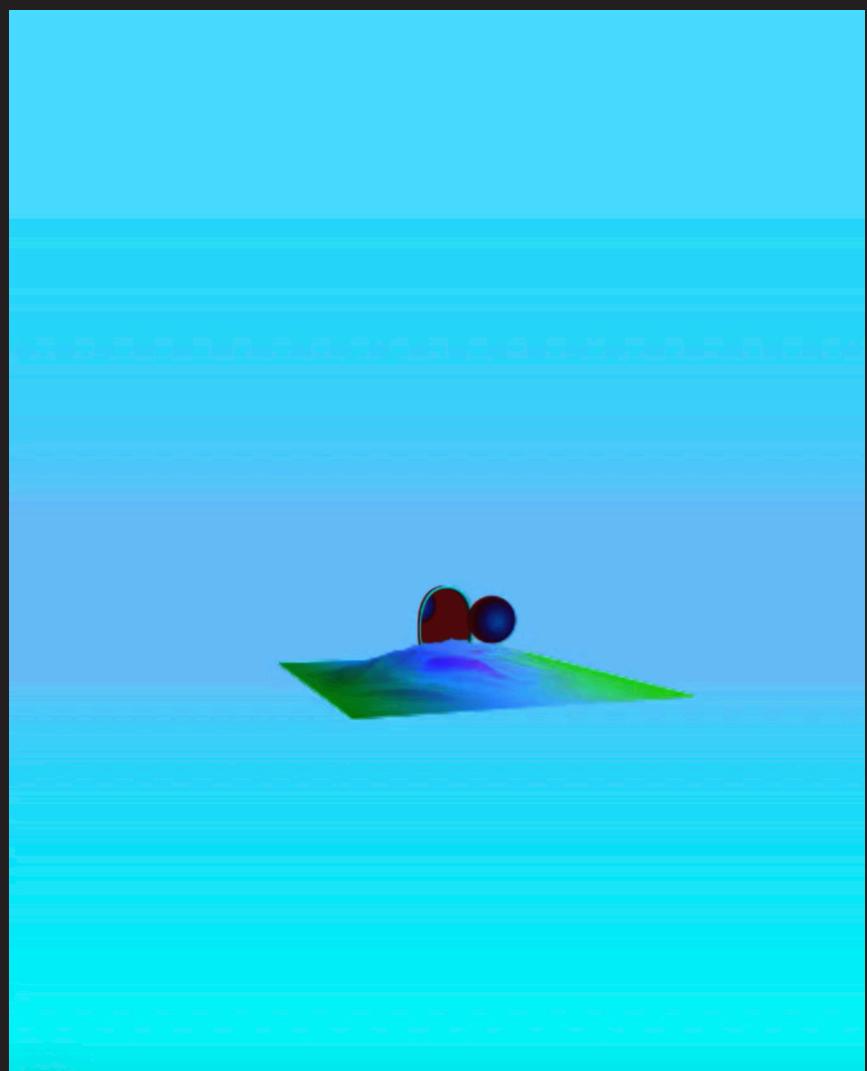

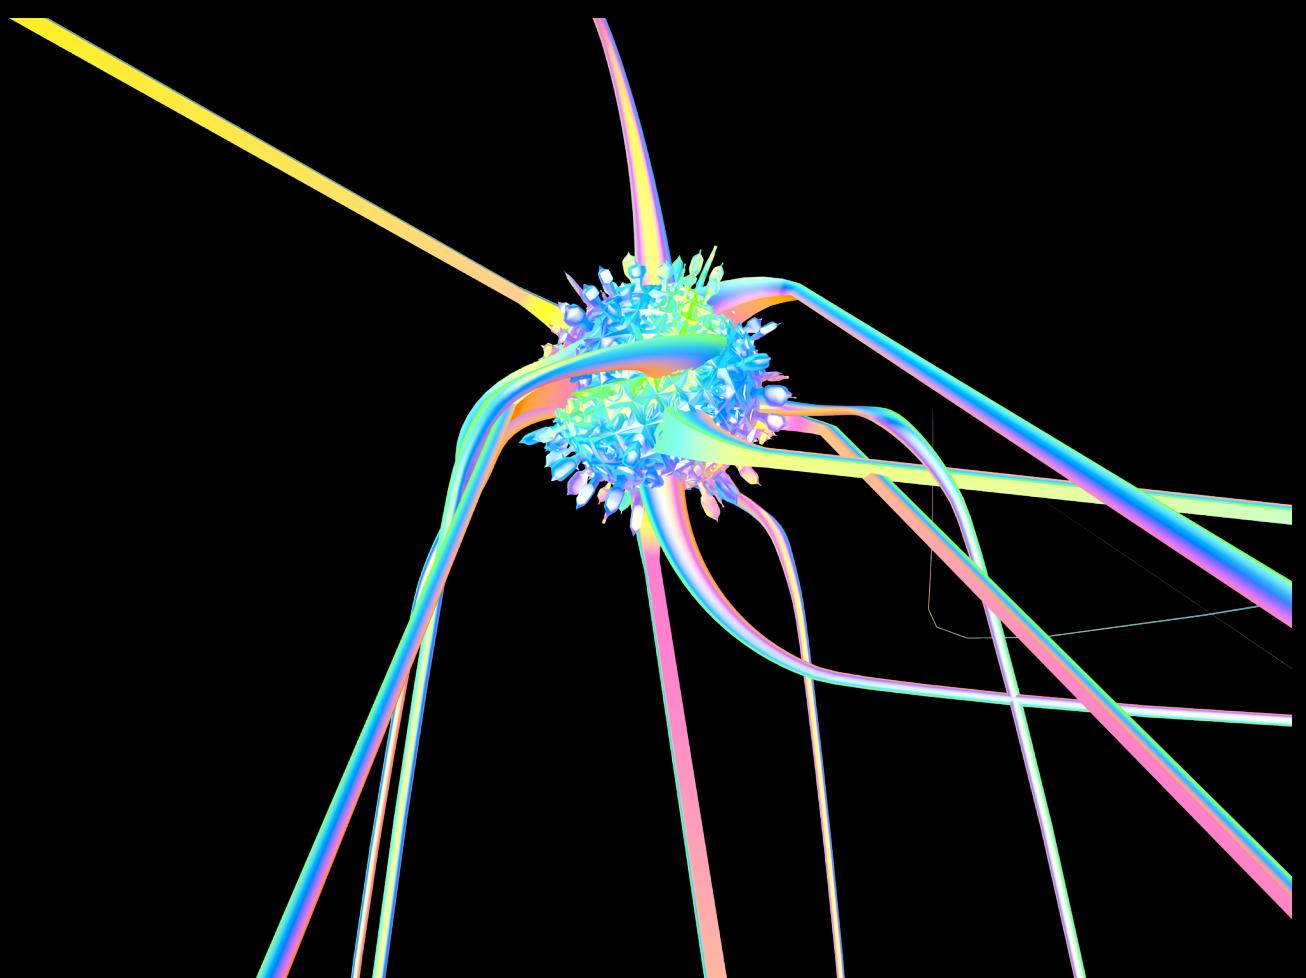

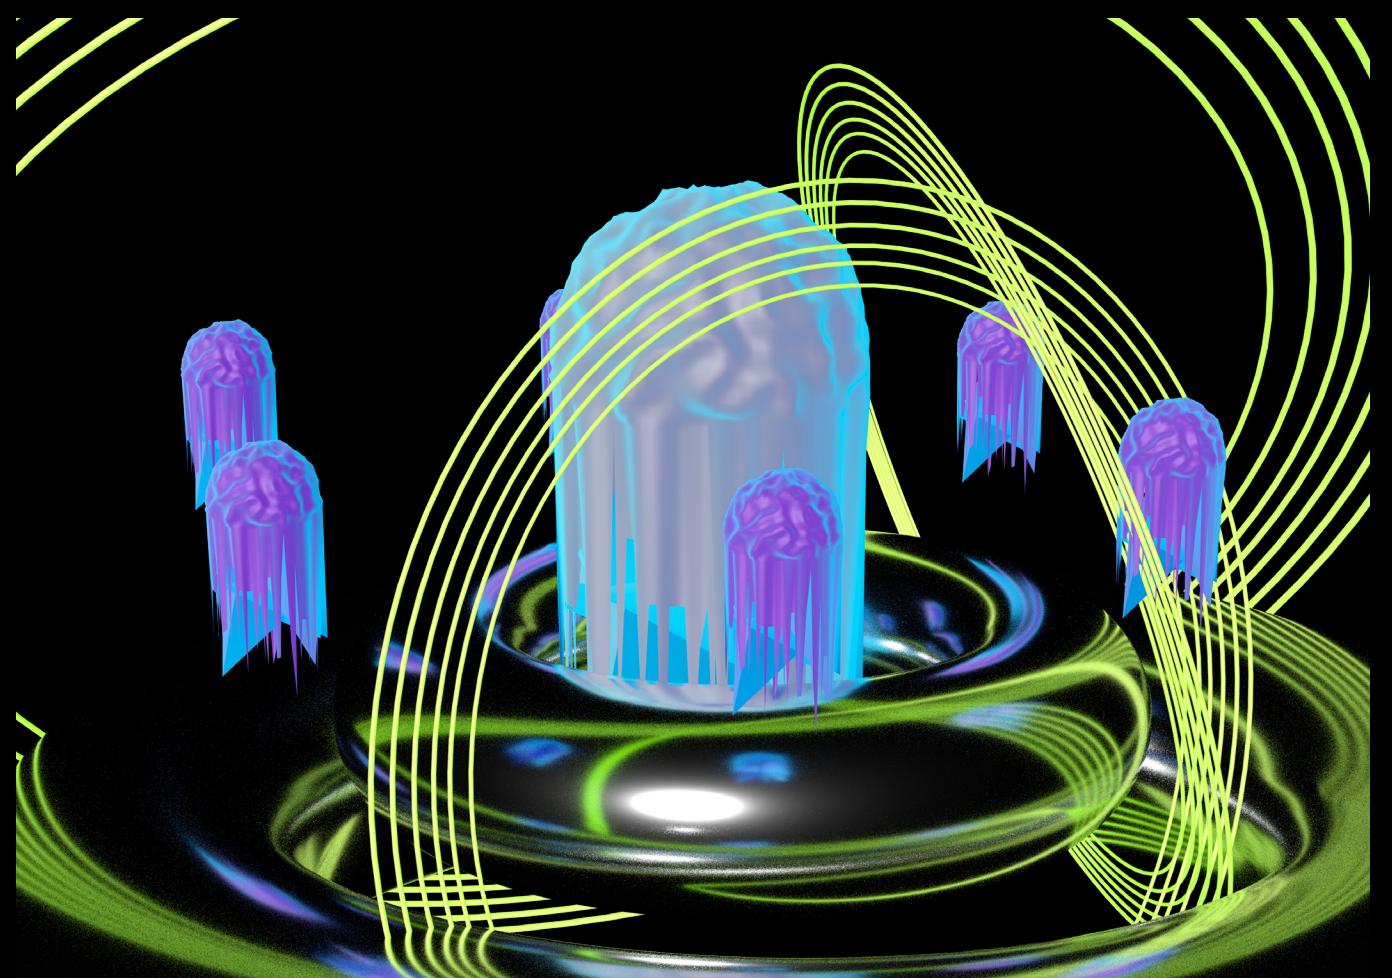

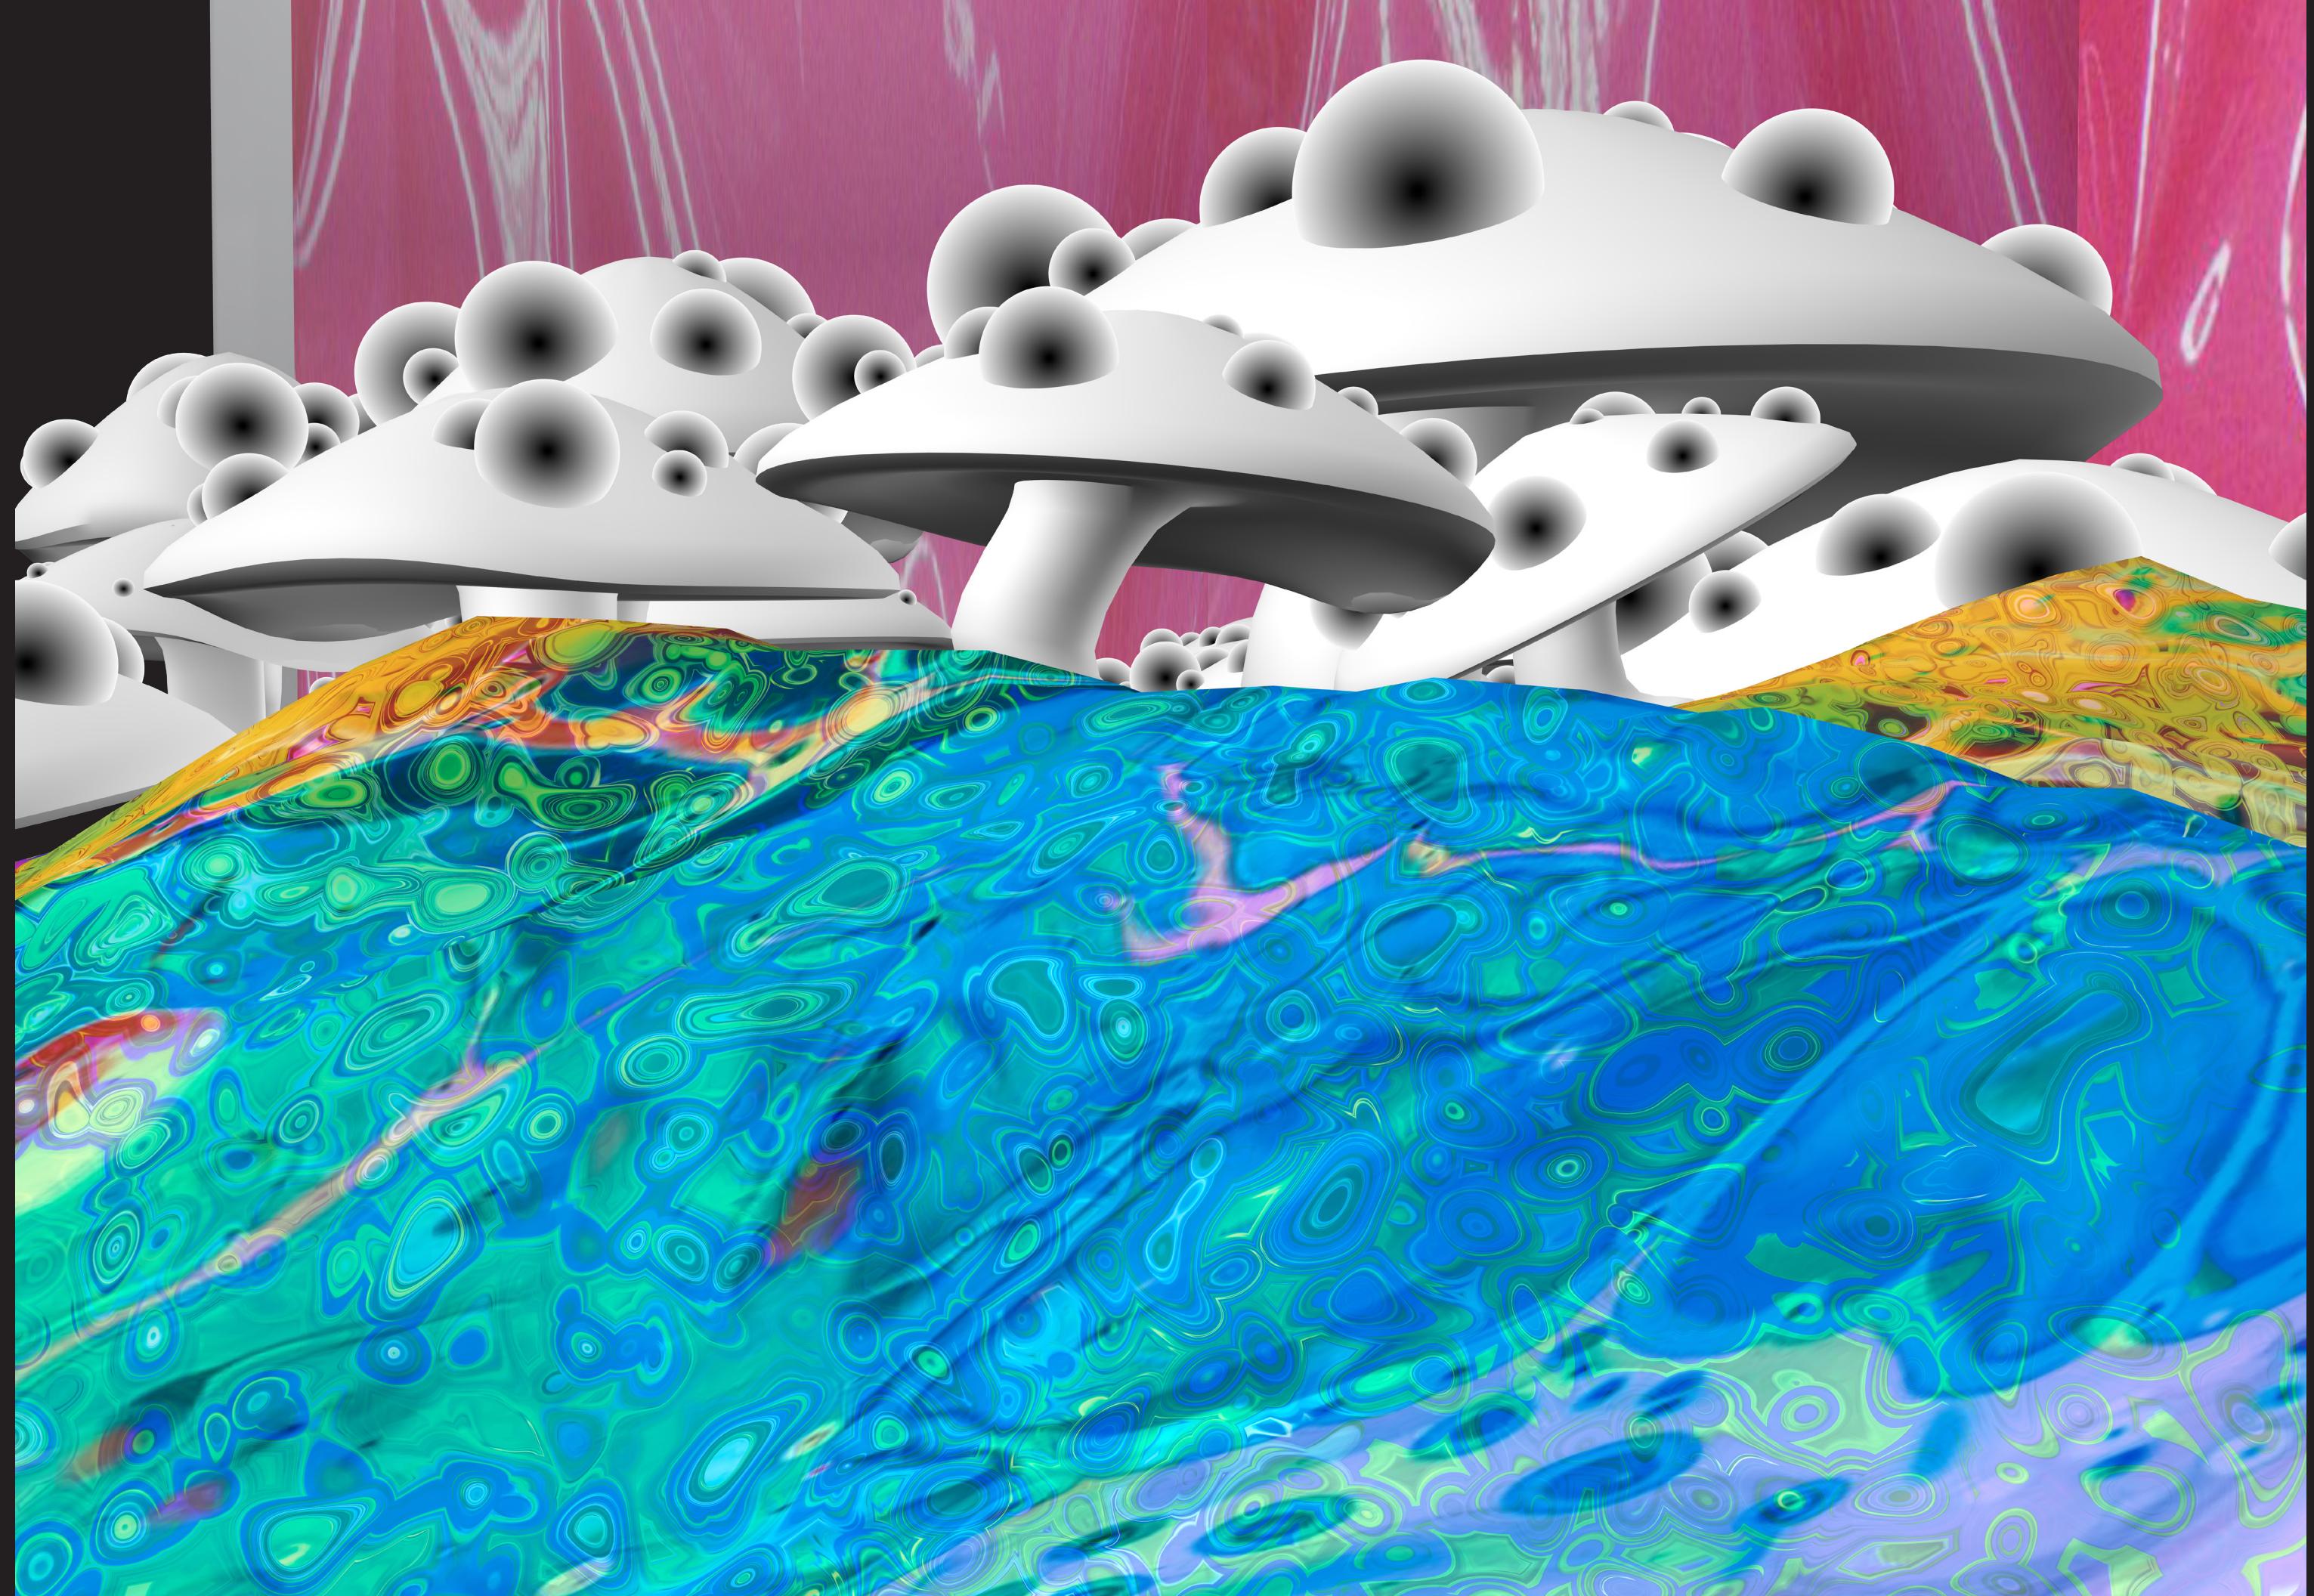

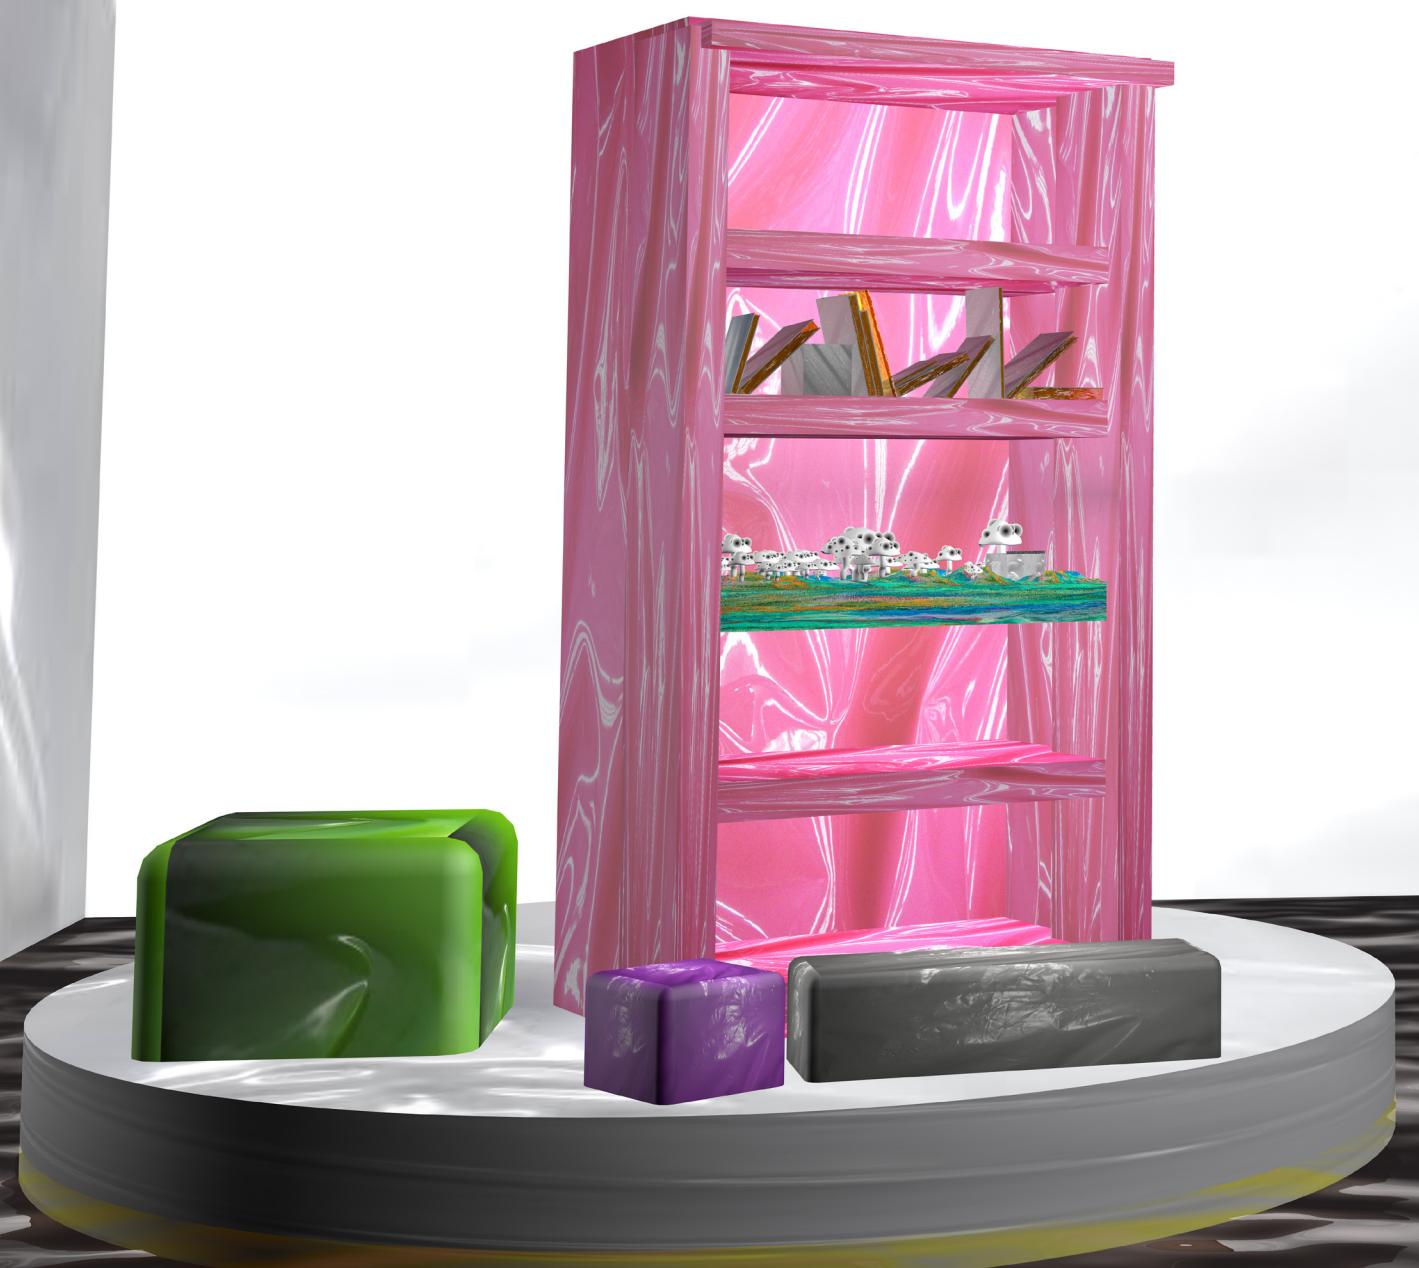

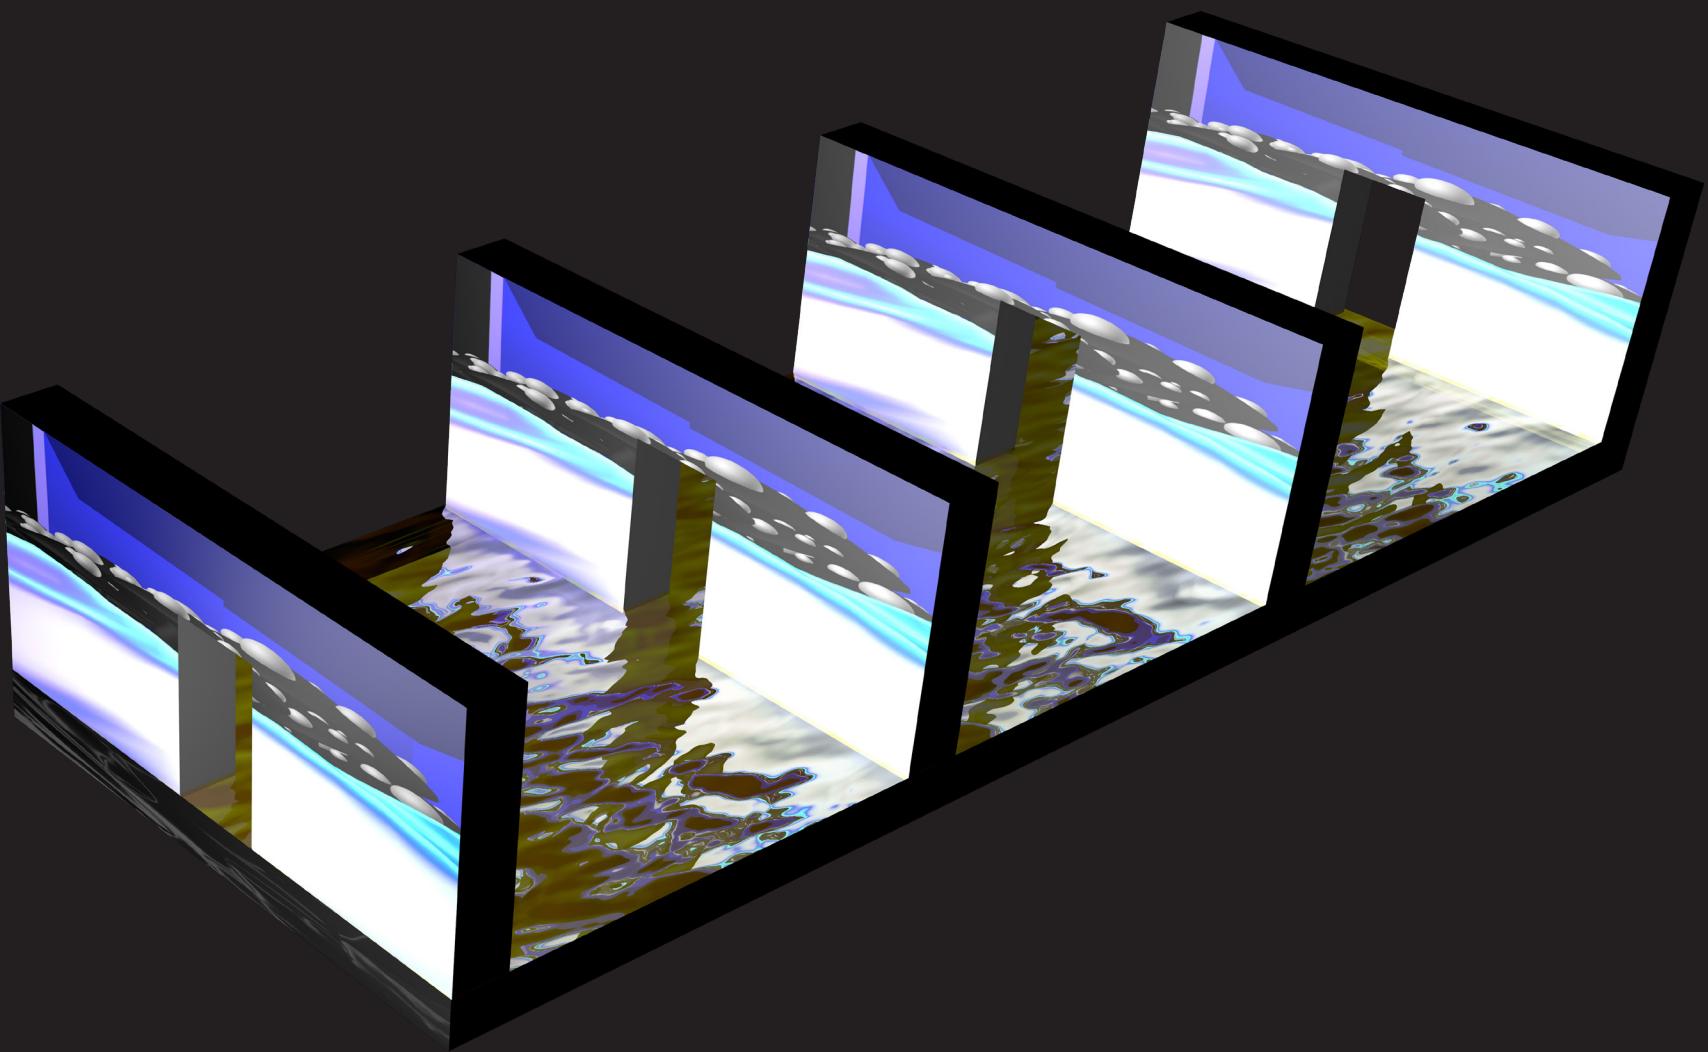

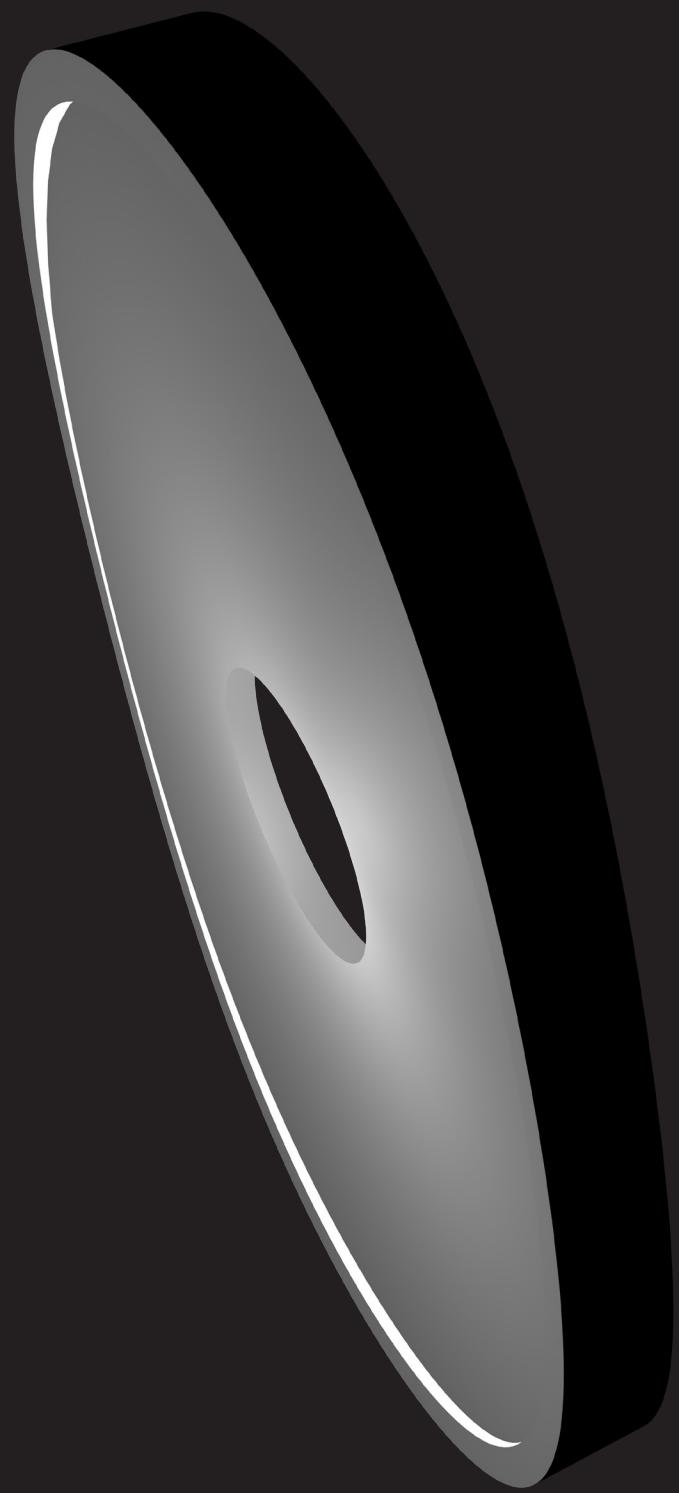

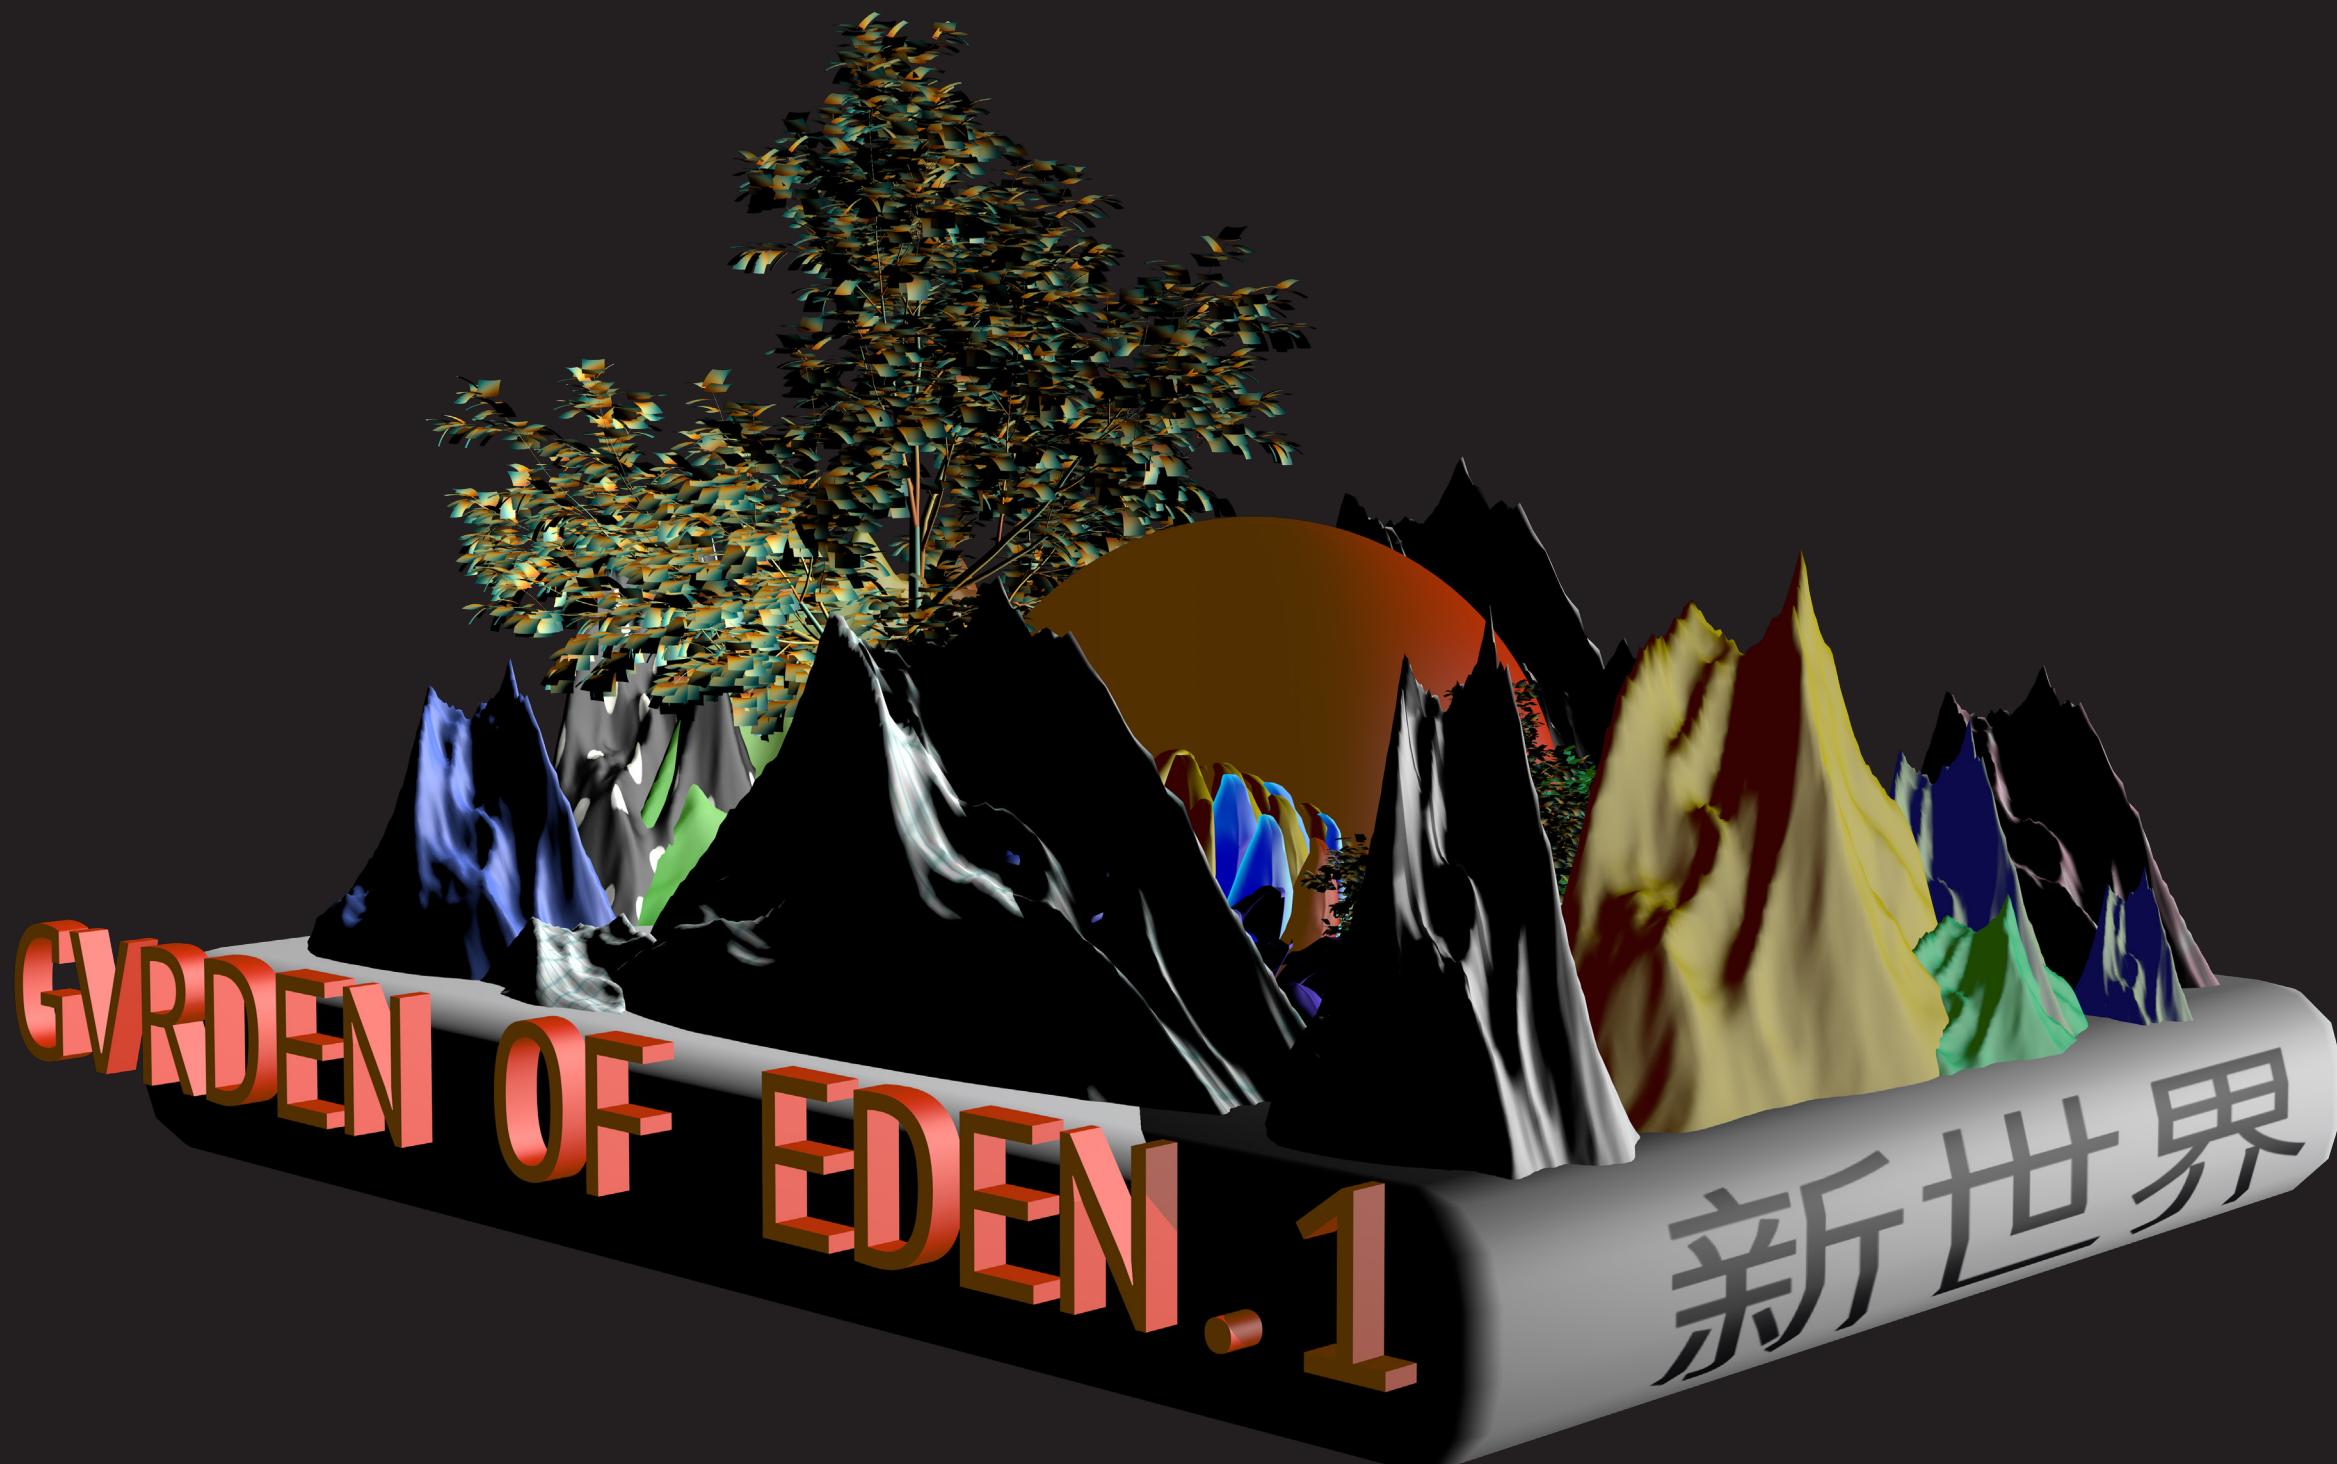

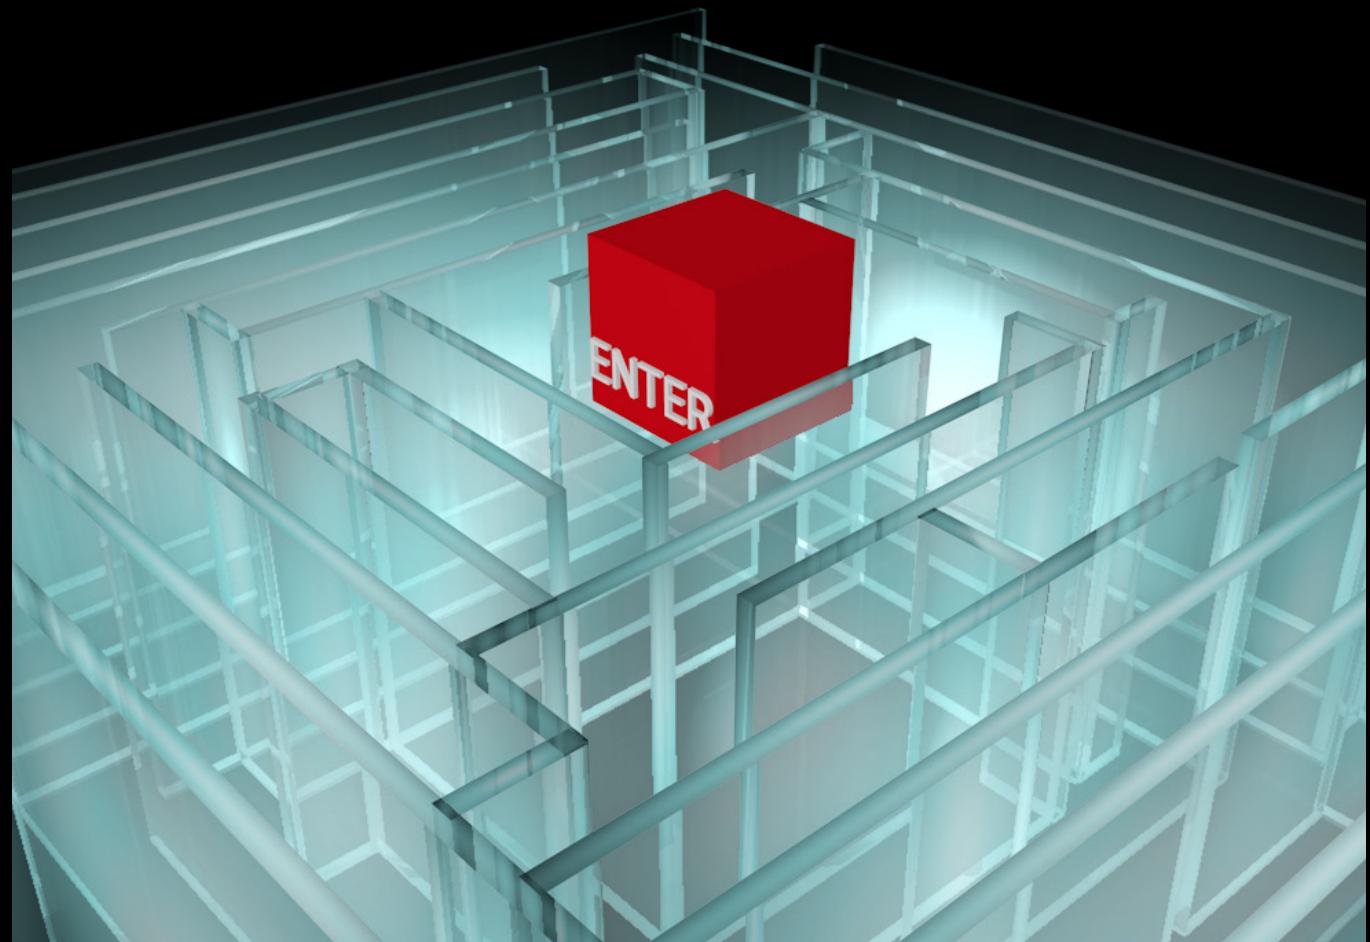

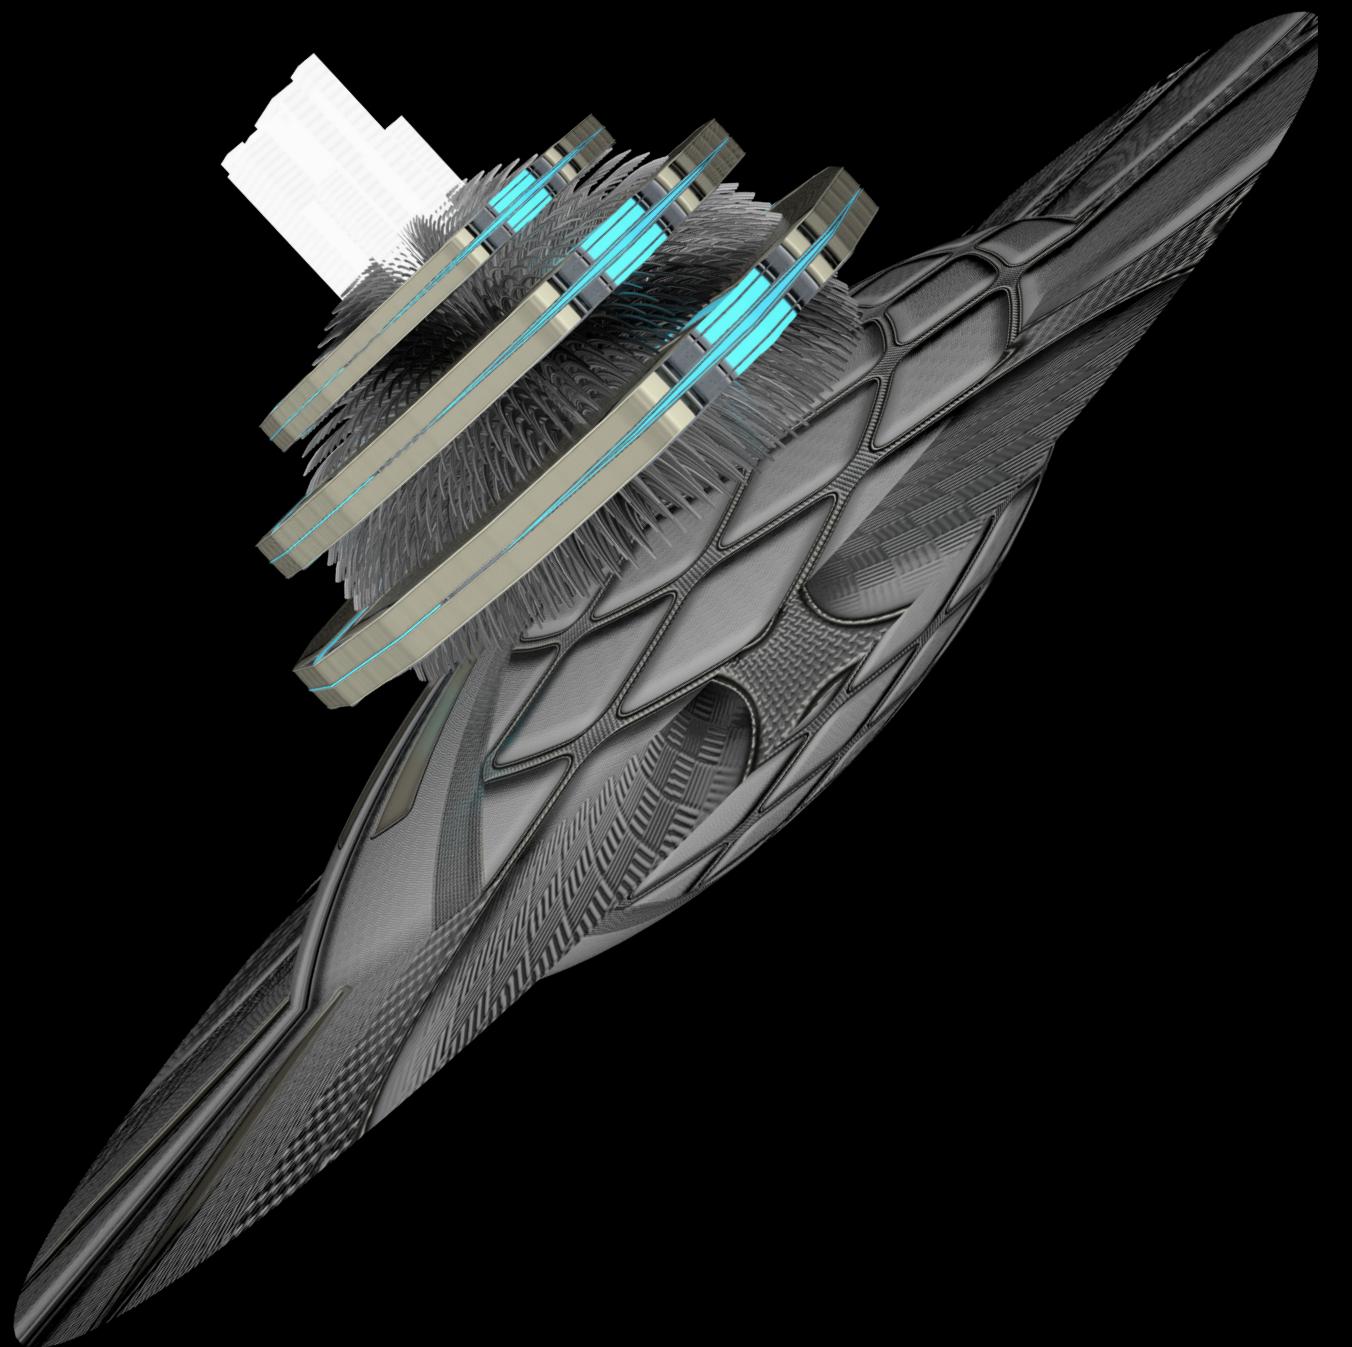

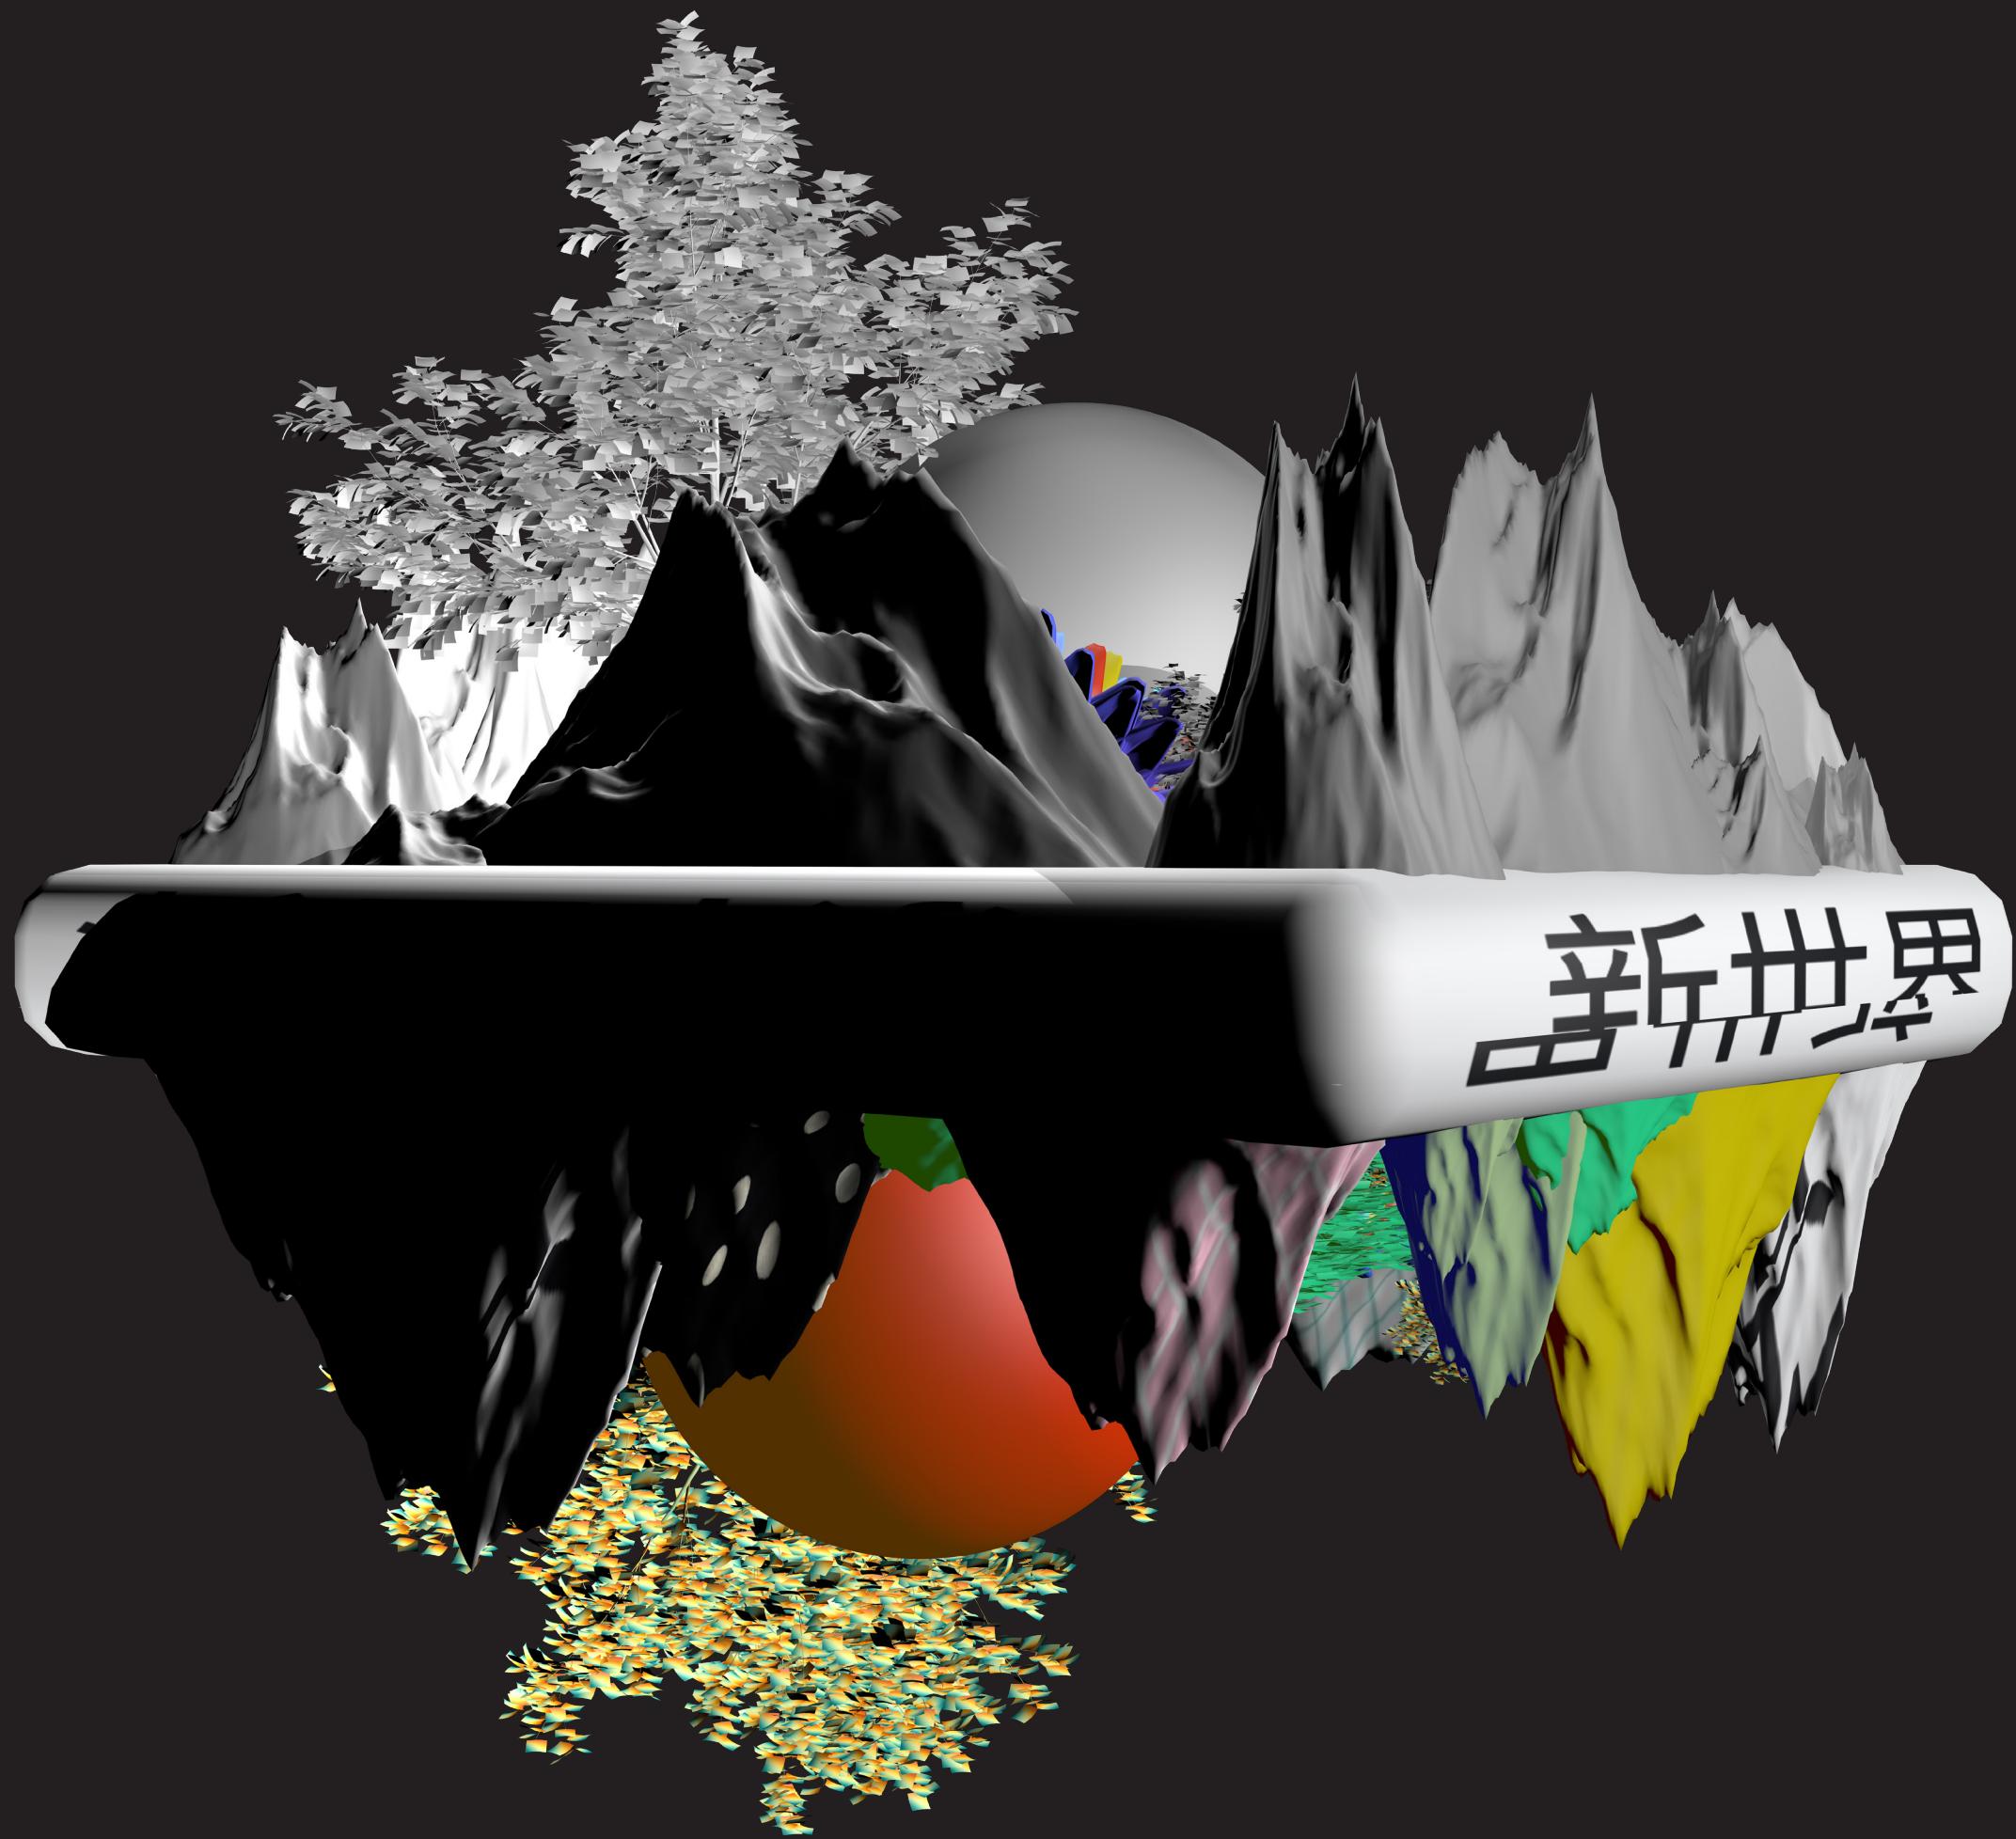

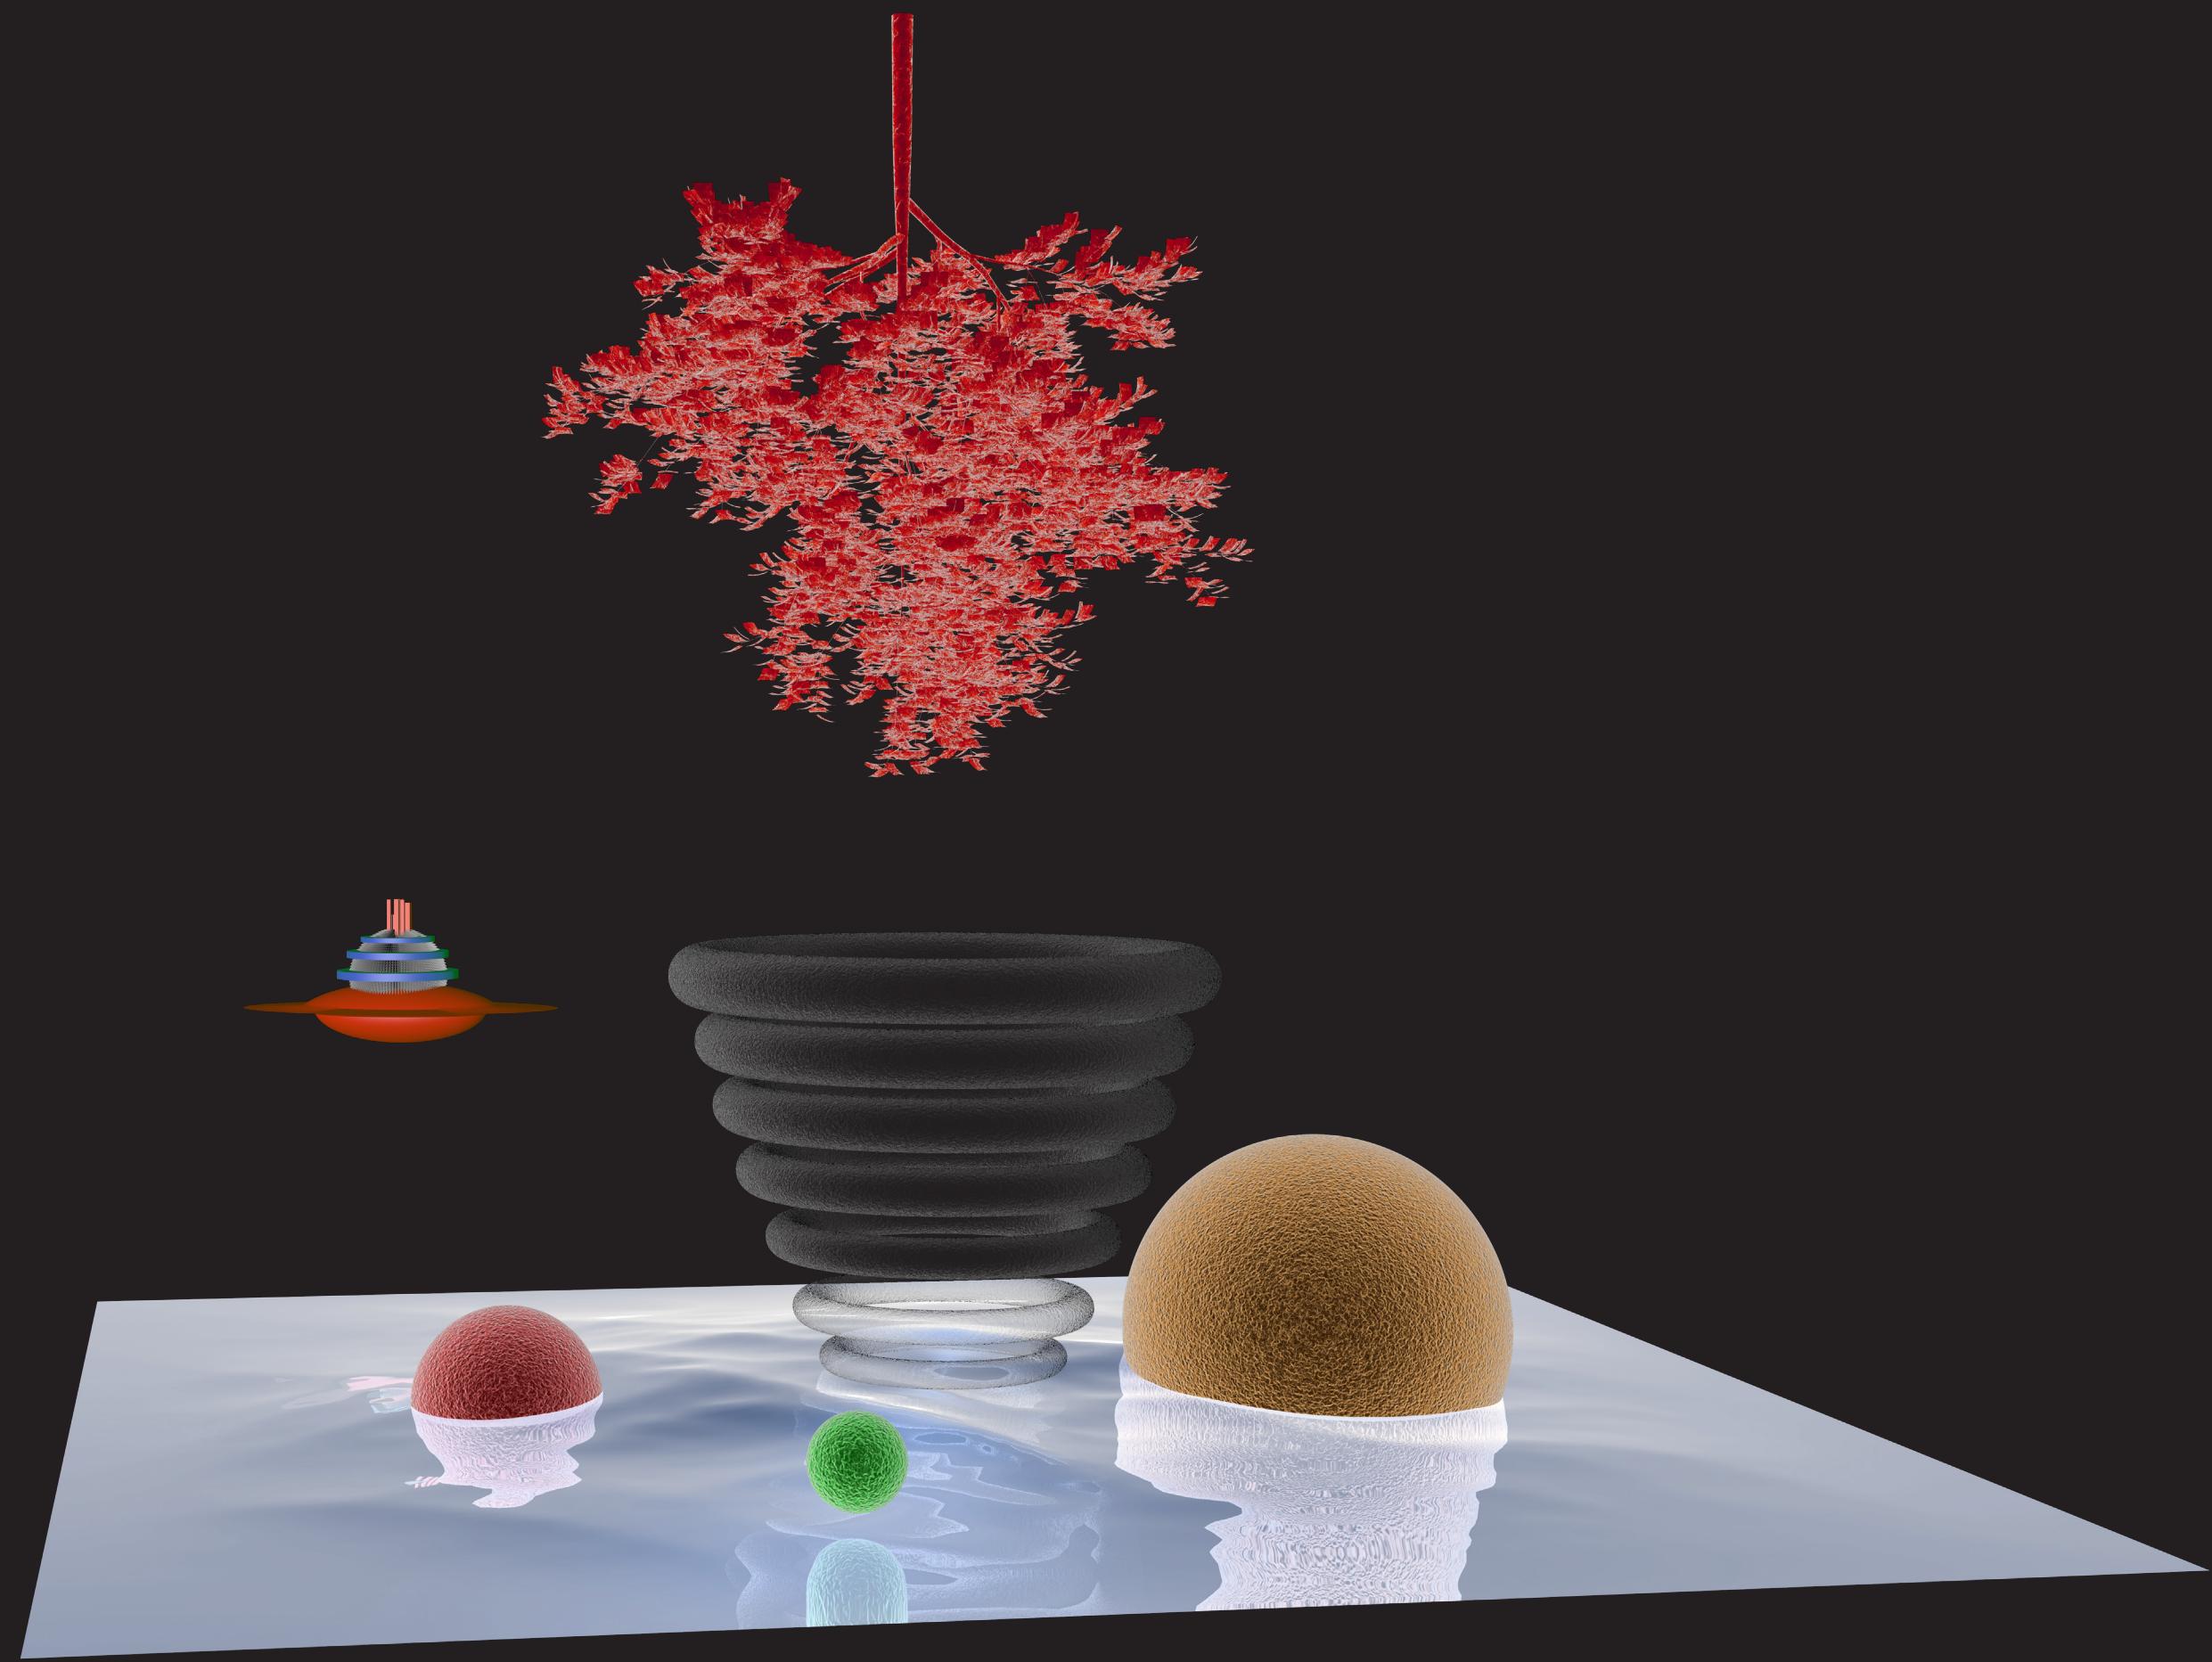

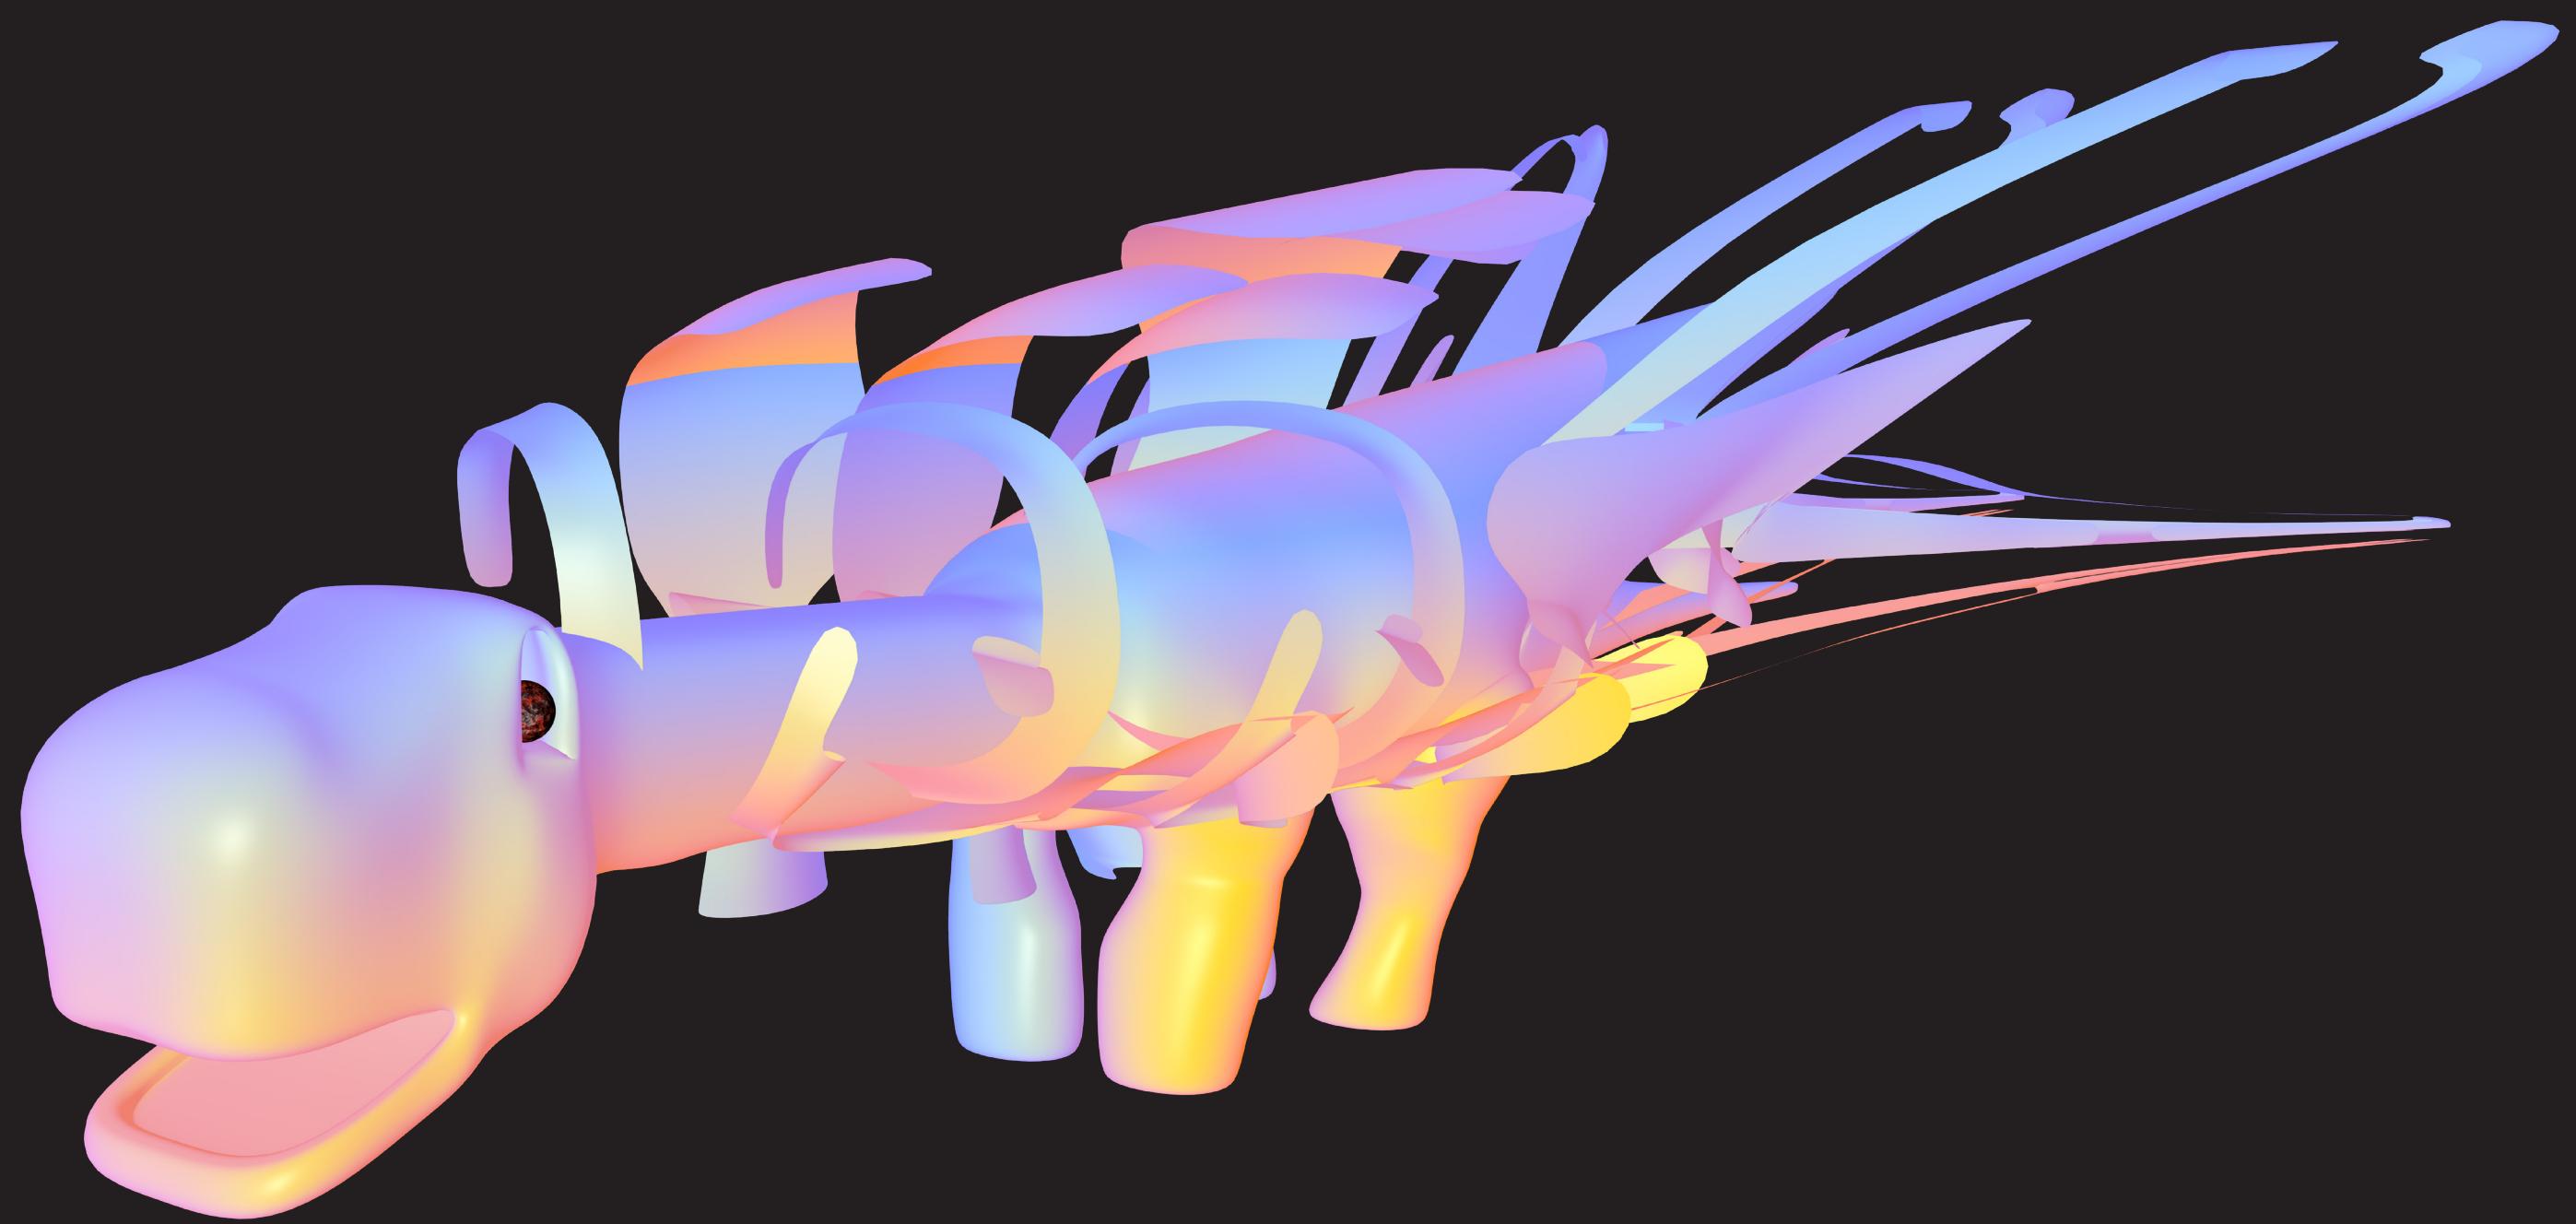

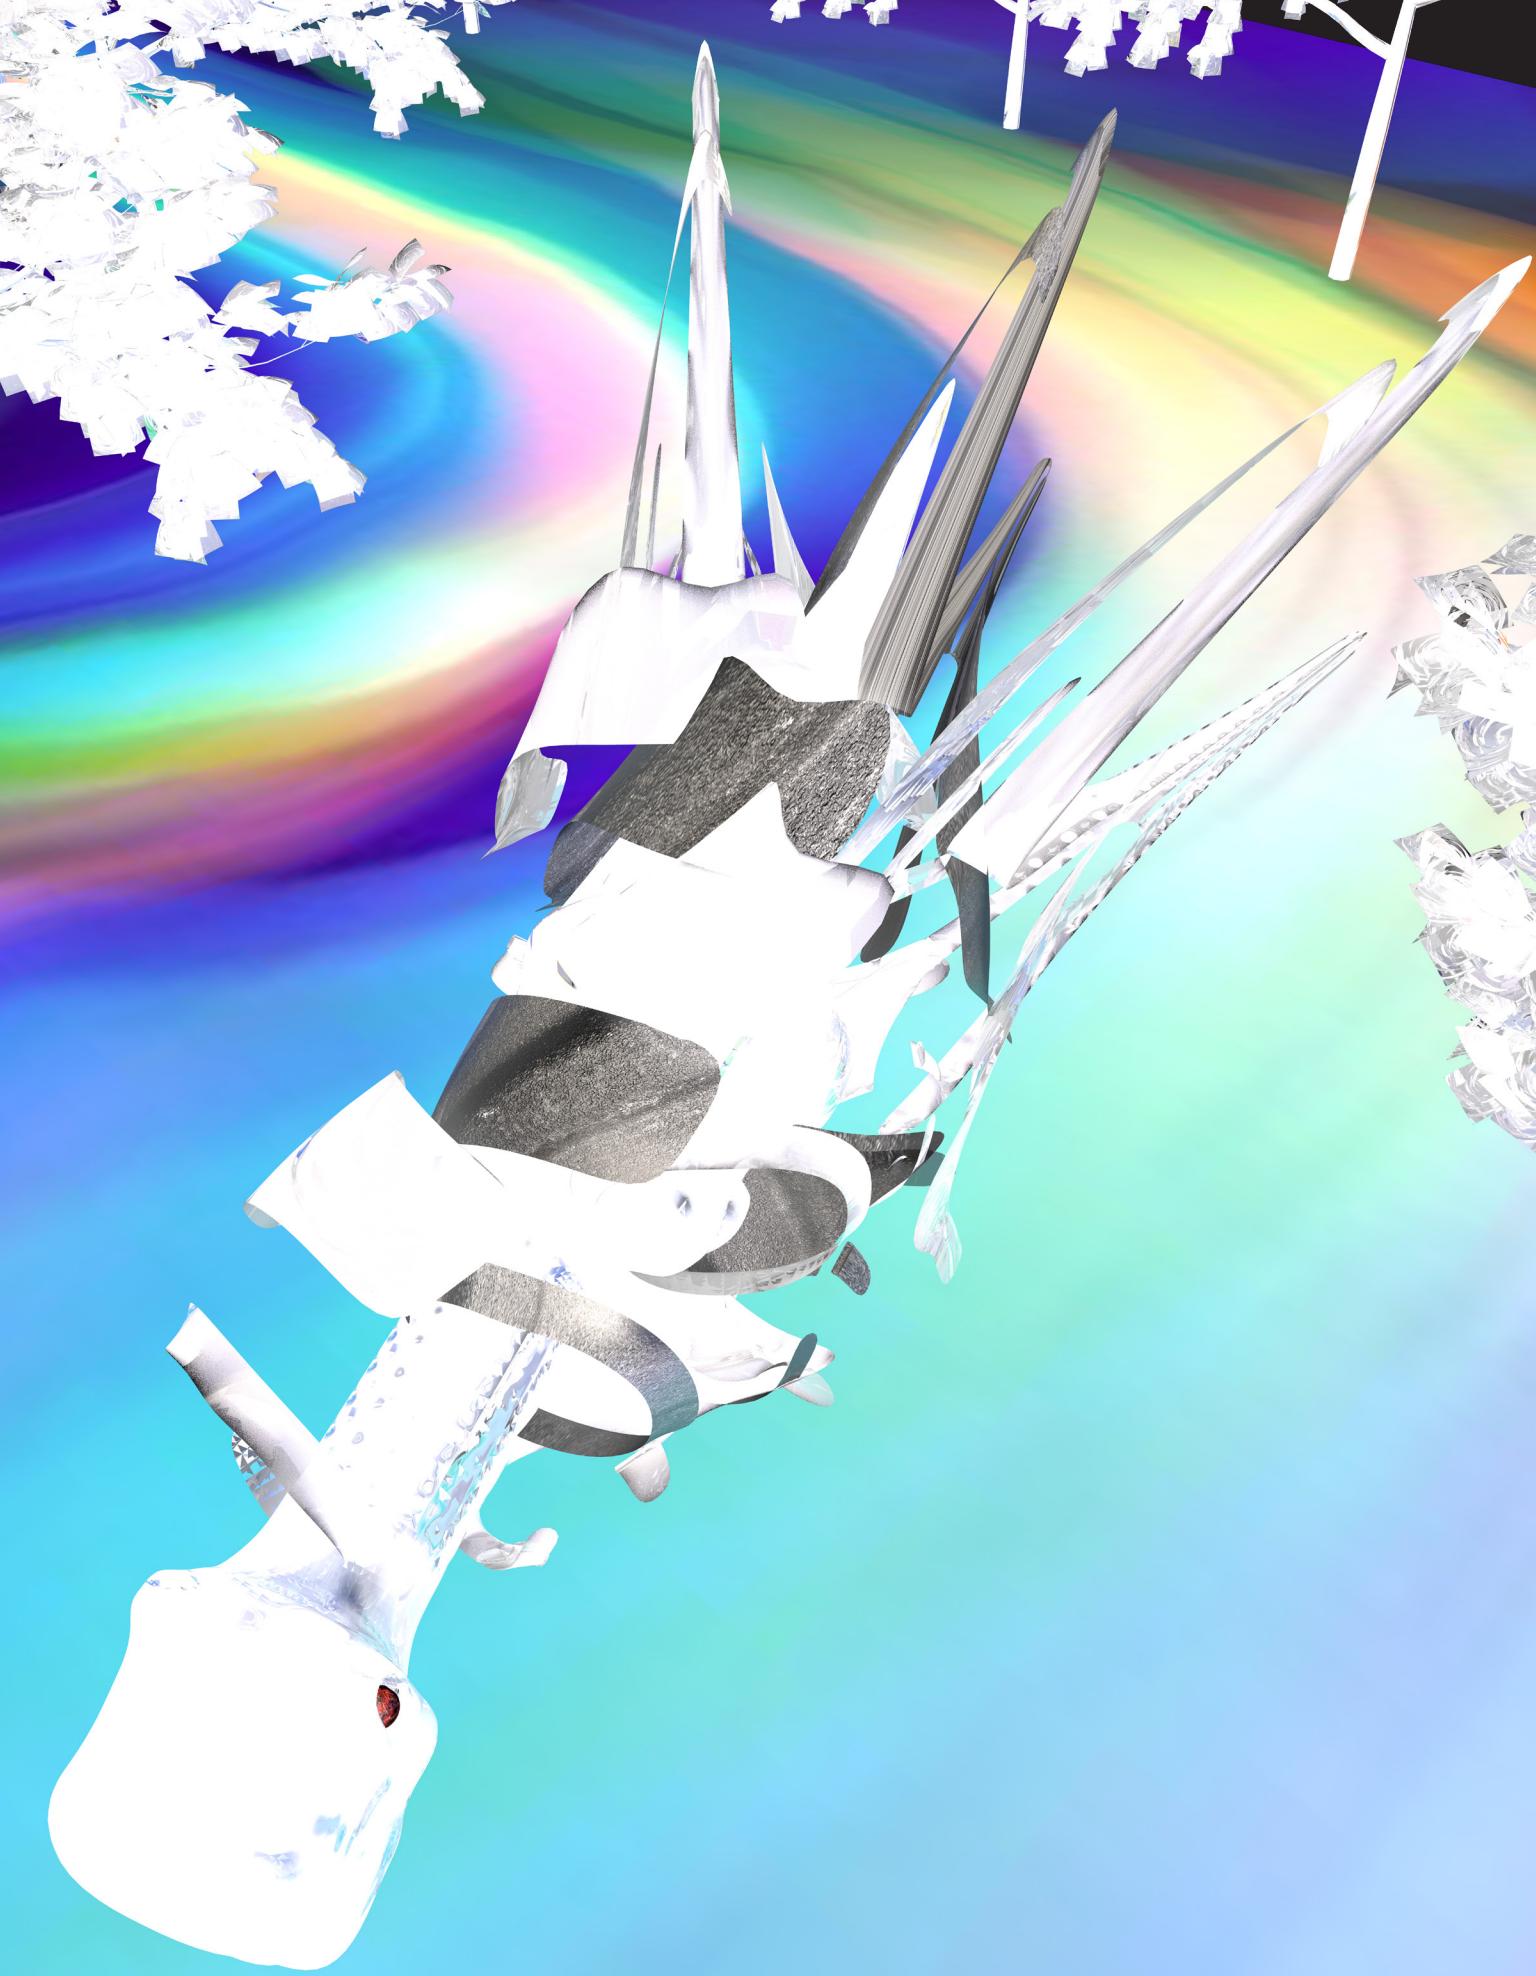

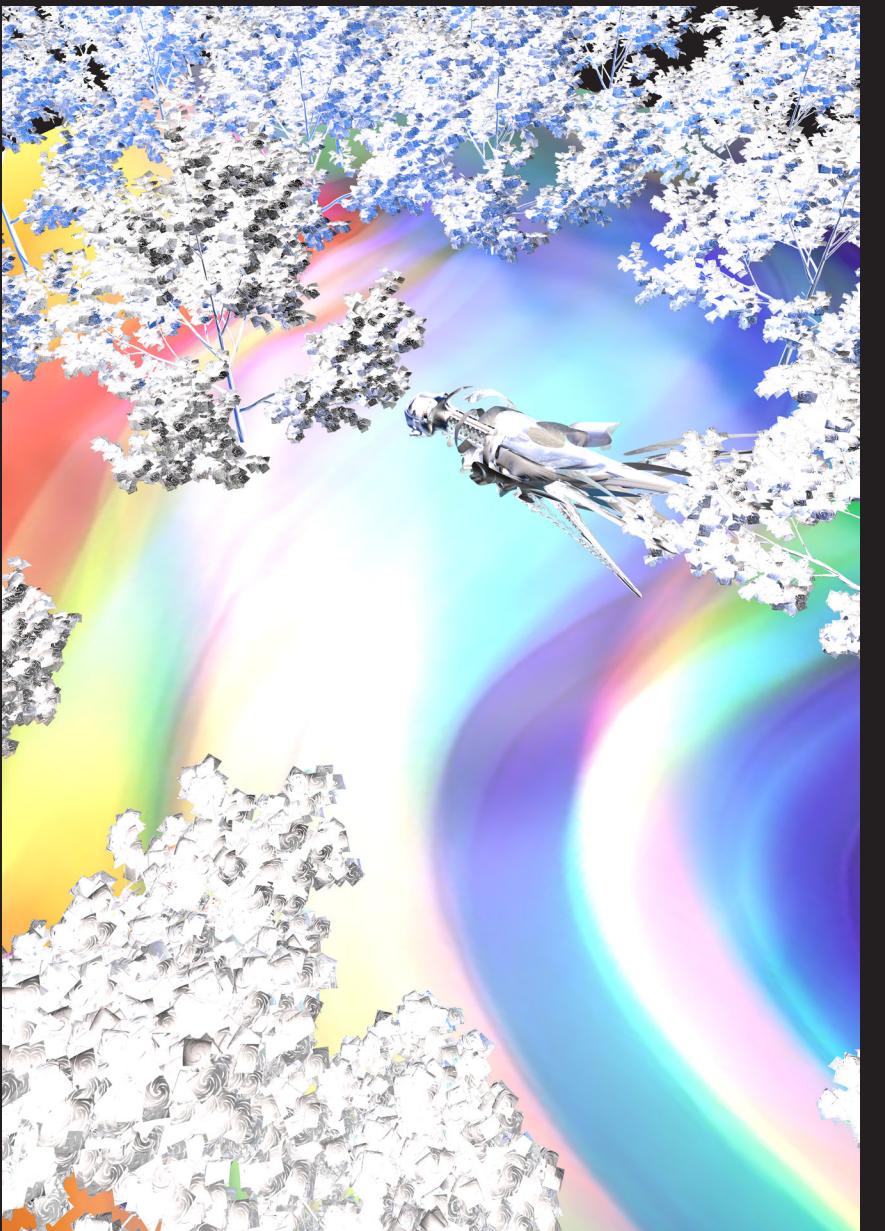

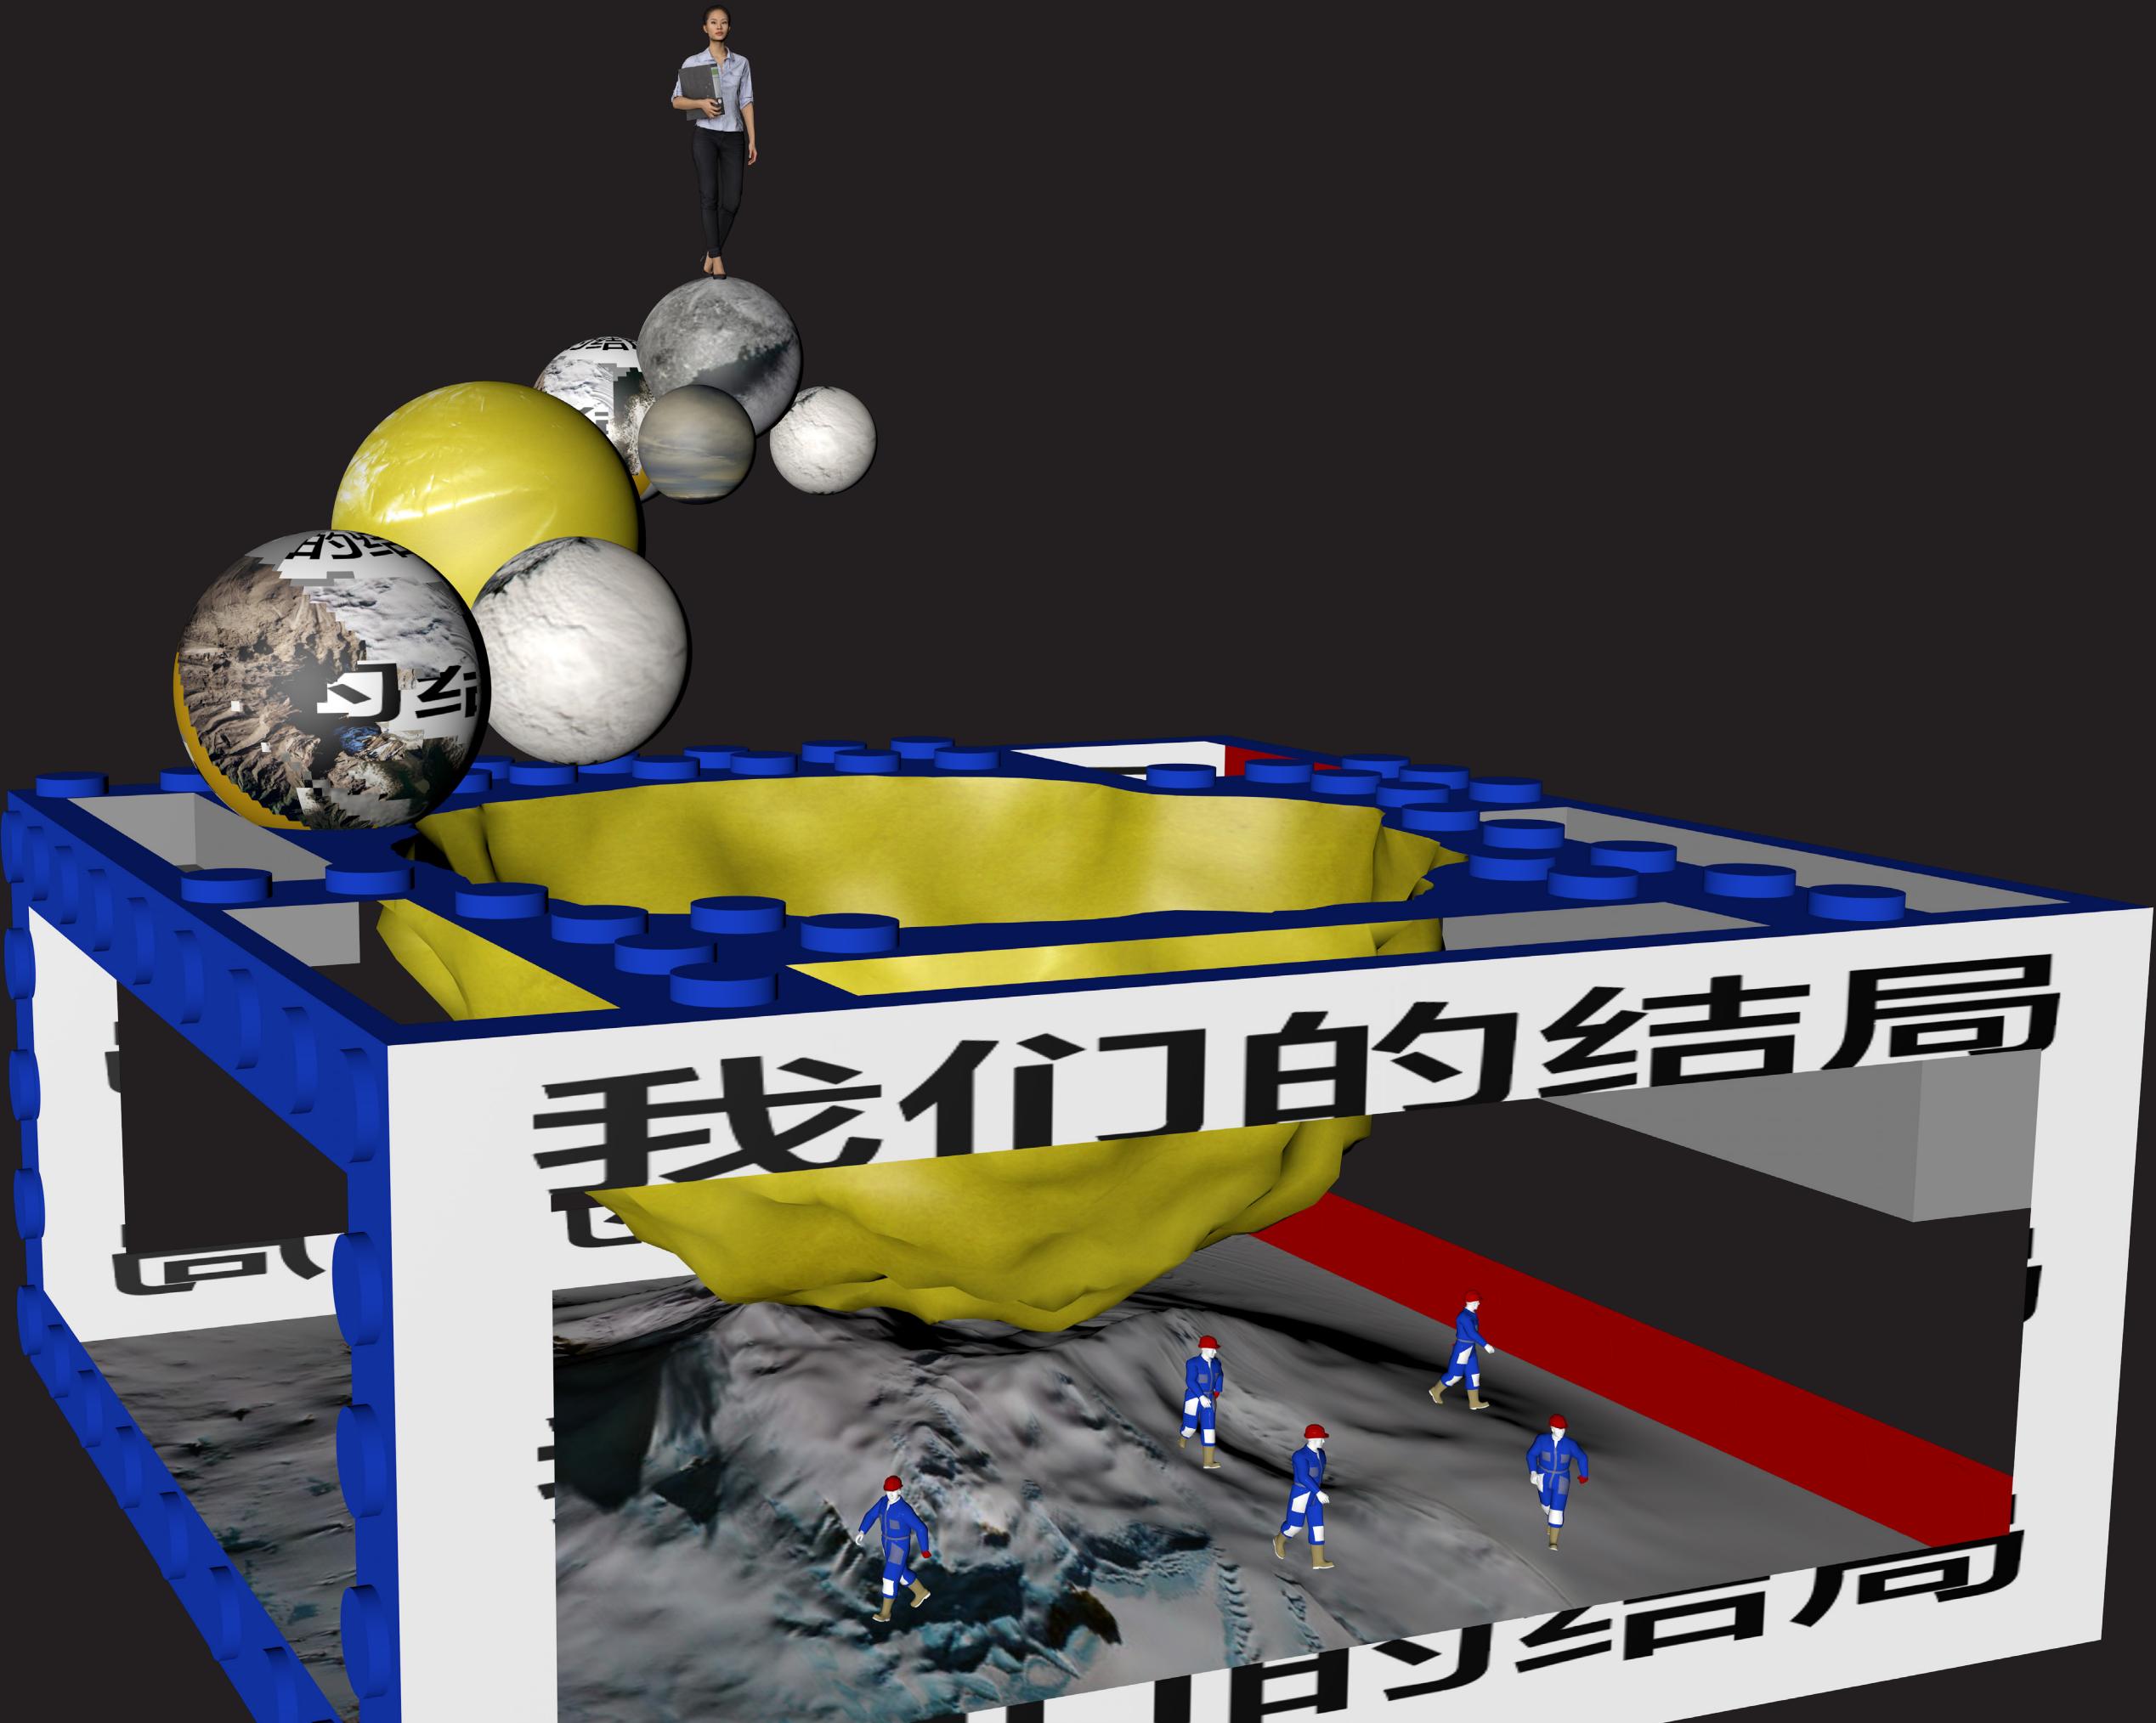

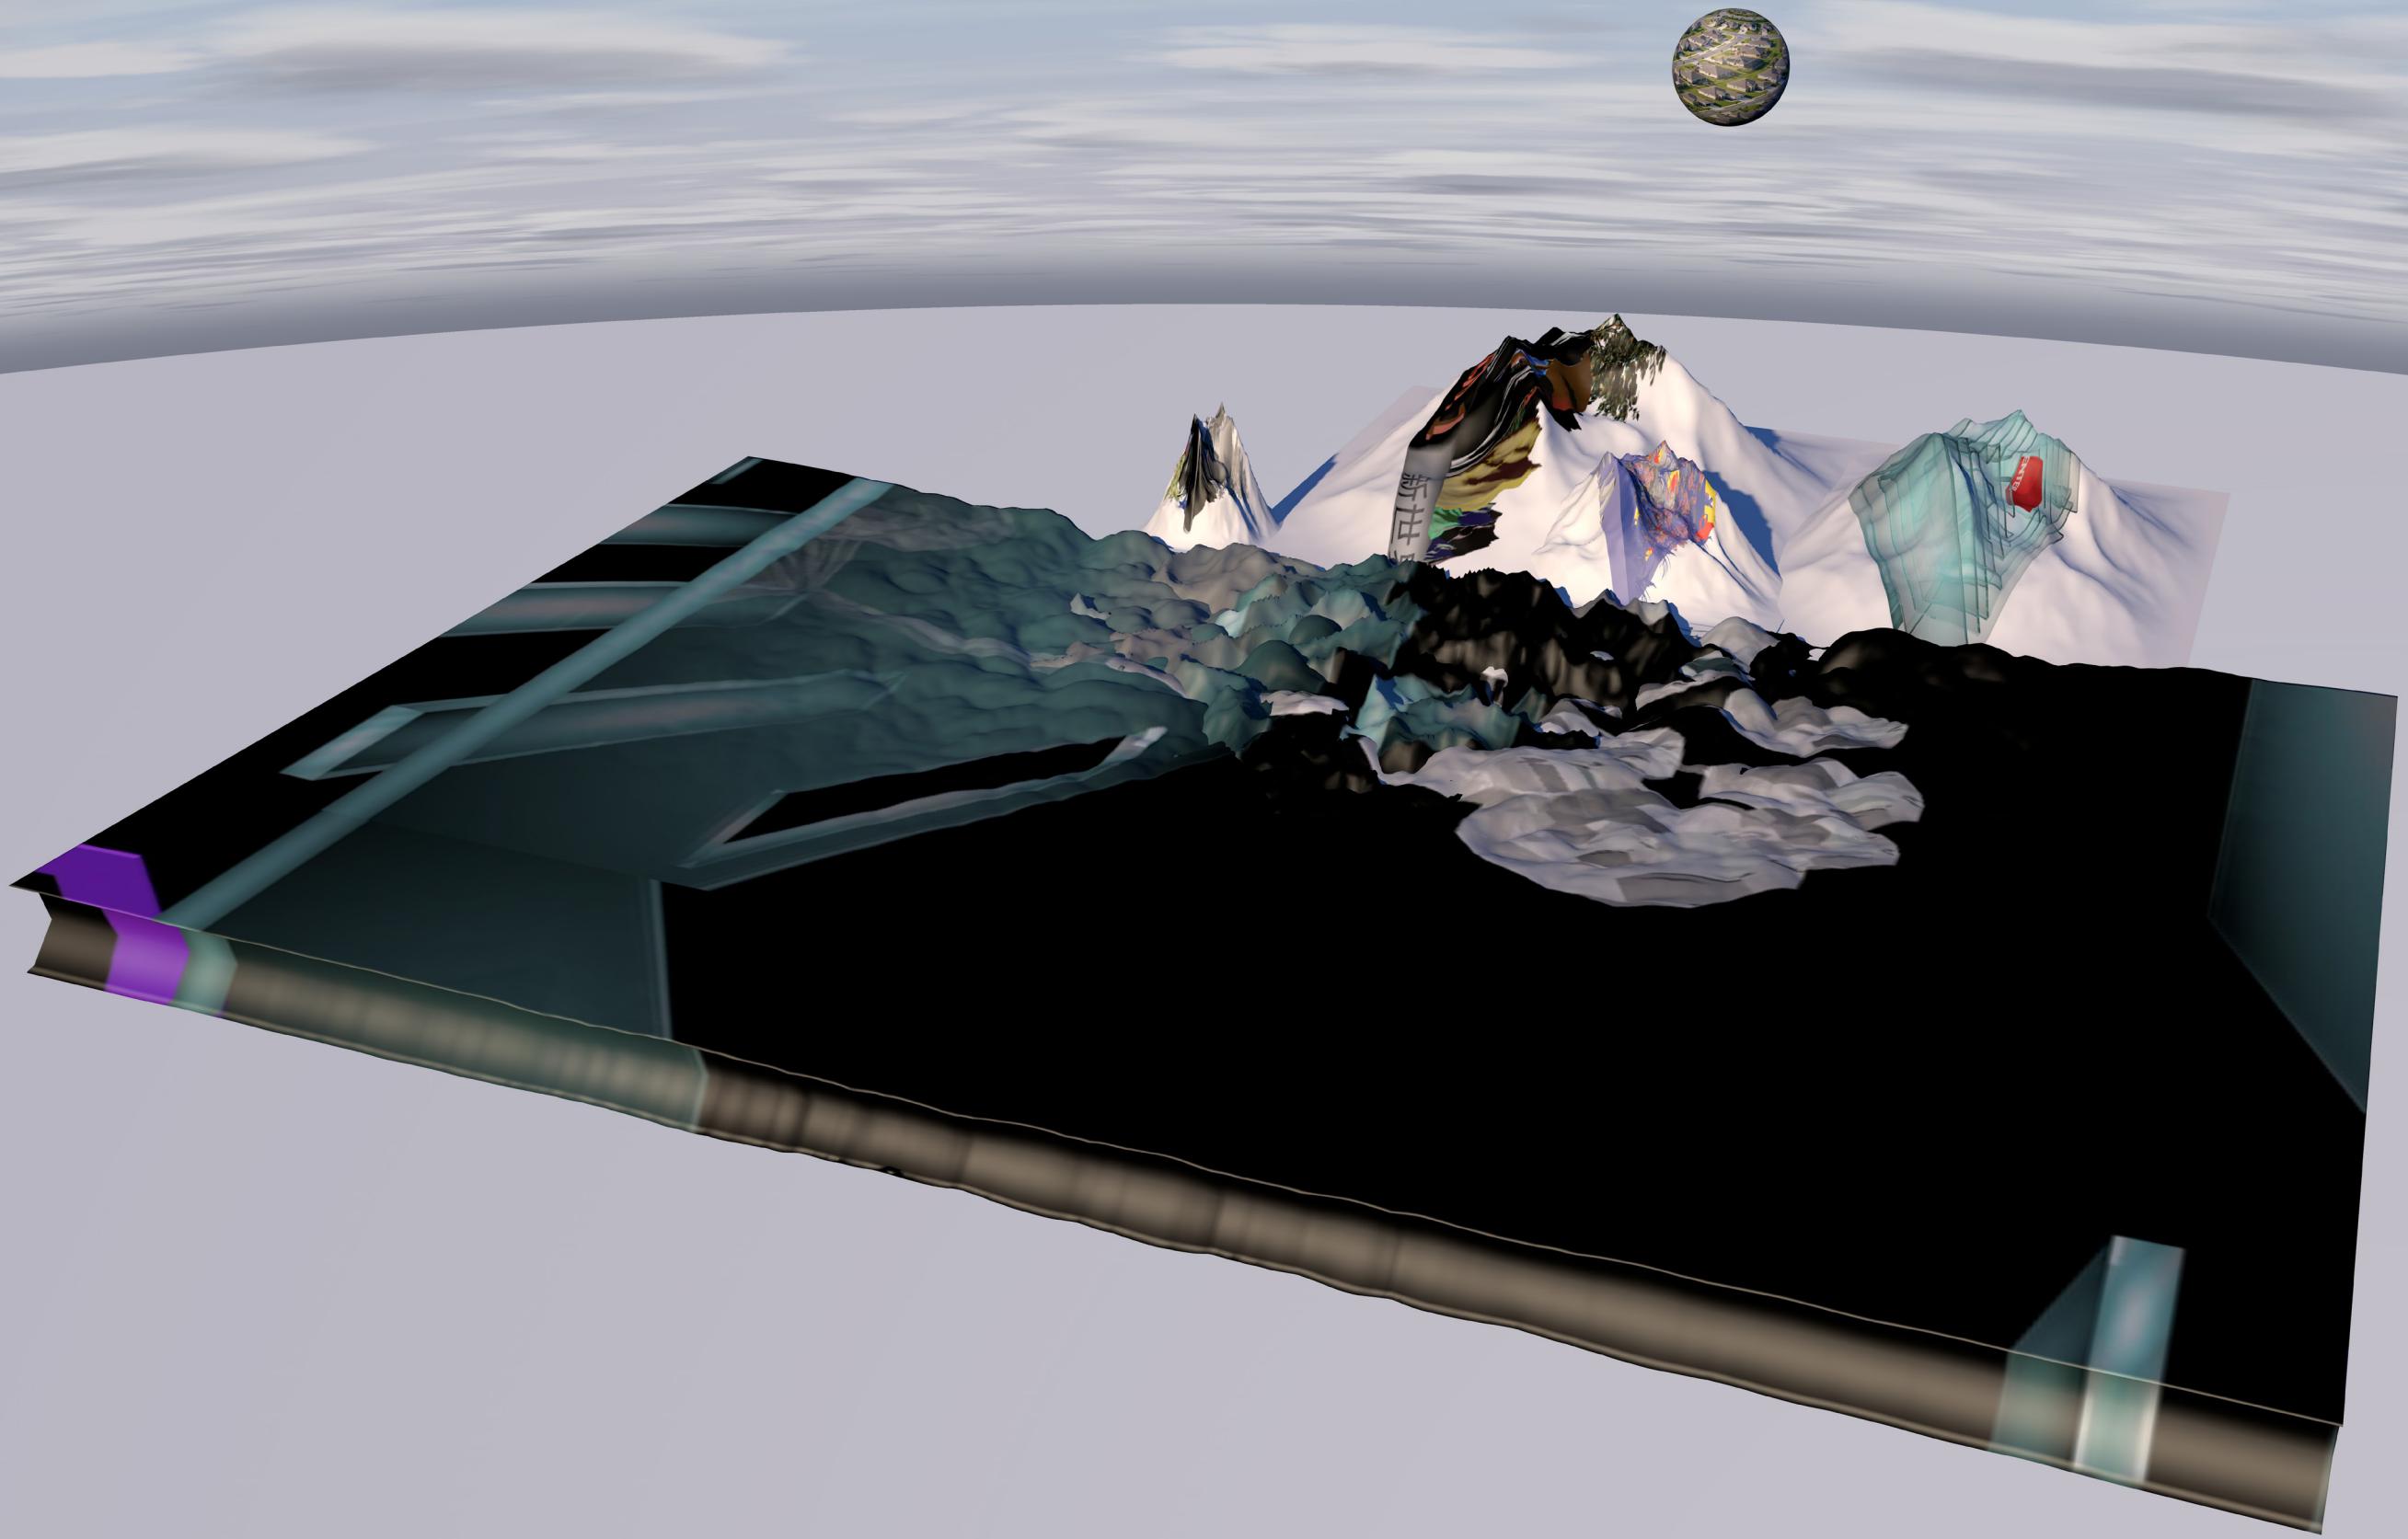

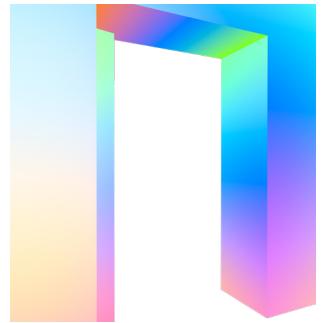

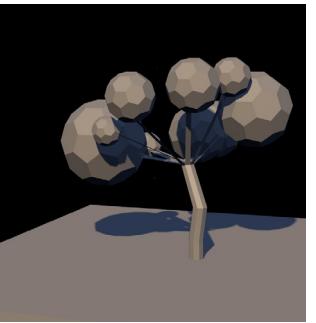

INDEX

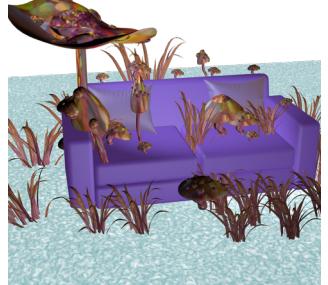

A little boy accidentally comes across the portal to another dimension. The door opens, beckoning him to see what reality awaits.

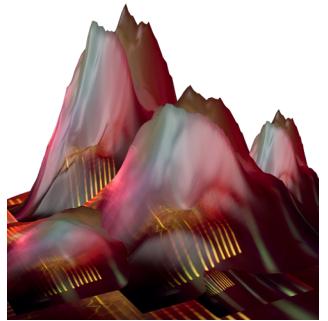

In another world, life exists beyond the limitations of physics. A tree is discovered living in an unknown sector of a galaxy.

"Strange particles observed by an experiment in Antarctica could be evidence of an alternative reality where everything is upside down... In this mirror world, positive is negative."
-Jon Cartwright, science journalist.

In the middle of nowhere in an icy land, a lonely couch exists, growing mushrooms, waiting to be discovered.

It also allows objects that look like large flying carpets, or membranes, which are two dimensional surfaces. And what that means, within string theory, is that we may be living on one of those gigantic surfaces, and there can be other surfaces floating out there in space."
-Brian Greene, physicist.

The laws of gravity are comparatively weak in relation to other laws of science, and is not the same in every dimension. With different gravity, they can swim in the sky.

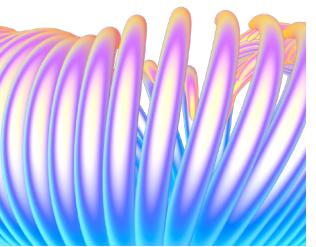

A watchful eye sits on a planet, looking for somewhere to go.

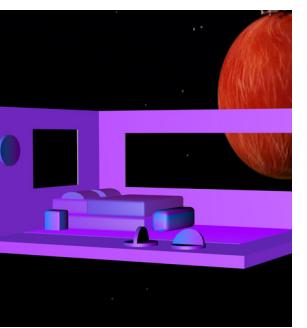

This version presents an alternate way to travel through dimensions. In each room is an orb that contains a different reality and rooms are easily accessible through open doors.

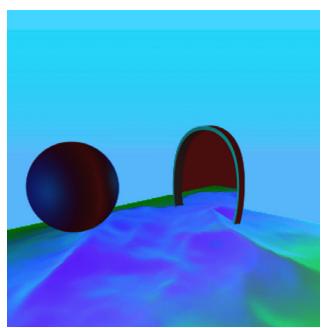

Mushrooms are known to be hallucinogenic and often represent magic in the fantasies humans create. In an alternate universe, what do they look like?

Extraterrestrial exoskeletons exist, floating and breathing in subarctic climates. What other life forms exist on this plane?

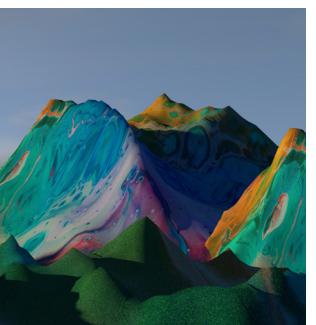

On a separate time space continuum, the observer on the planet is seen from inside of a floating room.

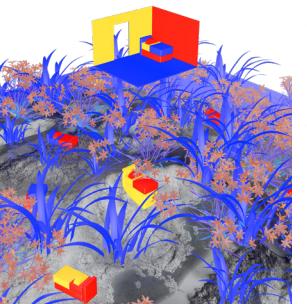

"Many modern scientists posit the existence of a mirror image of our own universe, and they're developing a so-called Mirror Image Theory to try to explain its implications. The expression "mirror image," which describes two things that are identical or closely resembling each other, could be extended to something as big as the universe itself."
-Zayan Guedim, investigative journalist.

1 - 8

Different dimensions of space and time can exist together. The rules are not black and white; there can exist an infinite number of worlds, some with other lifeforms and some without.

Parallel worlds could be accessed during REM, or rapid eye movement - the stage of sleep when the brain is most active and dreams are most vivid.

MICRO

EXIT

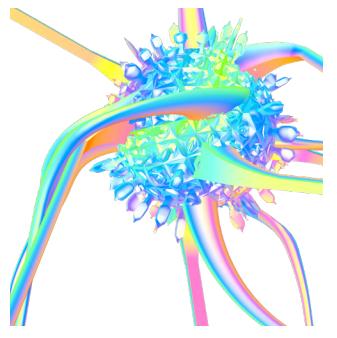

Sub-atomic particles make up matter. Their makeup could be drastically different in other realities, allowing for unexplainable matter to exist.

The Garden of Eden is a symbol of the beginning of the world. Its alternate exists somewhere in the multiverse and represents paradise, not paradise lost.

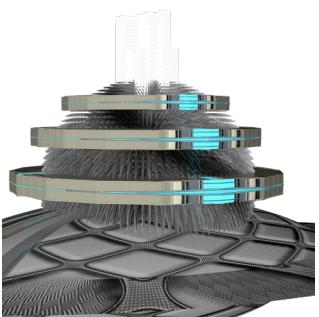

Dinosaurs symbolize the beginning of time and the beginning of the world that we know. In other dimensions, perhaps they still exist and live alongside humans.

Existing outside of space and time, they are almost impossible to visualize; the best one can do is to think of them abstractly, as static sculptures that represent the mathematical structure of the physical laws that govern them."

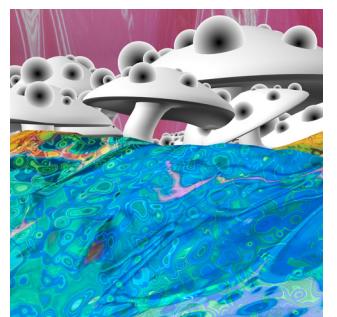

-Max Tegmark, professor of physics at M.I.T.

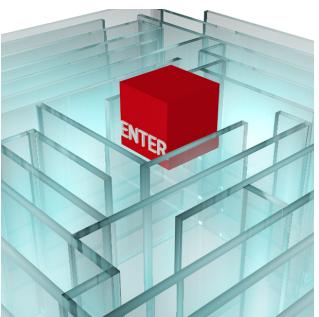

An astronaut spots a strange vessel in the black hole and flies towards it, hoping to find a way in.

A traveler stumbles into an enchanted forest, where a dinosaur resides.

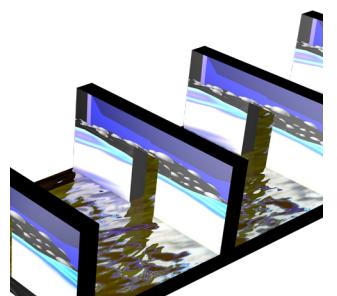

Dimension entry points can exist in unexpected places. They hide in plain sight, on bookshelves that are rarely visited, in dark and lonely crawl spaces, and in abandoned belongings collecting dust.

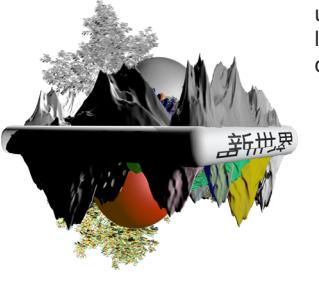

Travelers must remember entry and exit points when going in between worlds, or they risk never being able to find their way back.

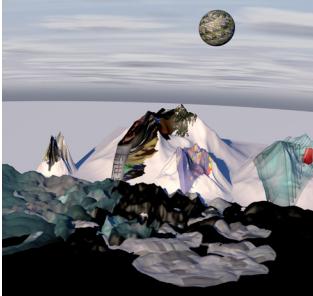

Unstable worlds are at risk of total destruction. Sometimes it's as if they never existed in the first place.

A traveler feels the disorientation of being stuck in a dimension, trying to find the exit.

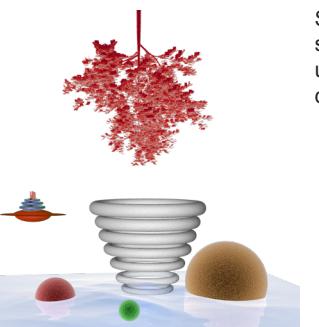

Perhaps there is a parallel universe directly under the one we live in, where everything is upside down and colorless.

One can return back to their home through a portal in any alternate dimension. A landscape of mirages of recently traveled worlds leads the way to the portal.

19-25

Somewhere in the black hole, a spaceship orbits around a floating, upside down tree preparing to descend into a world.

26-29
